Although the Project would exceed the population growth assumptions in the SCAG 2016 RTP/SCS, it's important to note that the Project is consistent with the City's housing strategy to direct growth in regional centers and areas near transit stations, major bus centers, and bus stops along a major bus routes. The Project is also a mixed-use development that would generate fewer vehicle trips than traditional single-use and subdivision development and would take advantage of existing infrastructure systems serving the area. Additionally, the Project would implement the majority of the proposed measures by the California Air Pollution Control Officers Association (CAPCOA) to reduce GHG emissions, which also reduce criteria pollutants, related transportation-related design features as outlined in its 2010 Quantifying Greenhouse Gas Mitigation Measures guidance document.

The Project would provide housing in a jobs-rich area and would consist of a mixed-use, transit-oriented development that would reduce the need for vehicle use for residents due to the Project site's proximity to local destinations and regional transportation opportunities. Therefore, while the Project would provide needed housing within the City and would result in development that would result in low VMT and associated mobile source emissions, because the proposed Project would not be consistent with the City's current General Plan land use designation and would result in population growth that would exceed the population growth anticipated for the City in SCAG's regional growth forecast, the proposed Project would conflict with Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook.

However, it should be noted that the impact is temporary until the Project is appropriately included in the City's population estimates and eventually, the SCAQMD AQMP. Since SCAG's forecasts are based on input from individual jurisdictions in accordance with their General Plans and local development trends and these are updated regularly as part of SCAG's regional planning programs, adjustments to these projections will continue to be made by the different cities and counties and SCAG as part of the regional planning process. This established regular update process will capture changes in development trends and capacities that occur over time. If approved, the Project would be included in future City projections that would be provided to and used by SCAG and SCAQMD to update the RTP/SCS and AQMP, and the potential impact is reduced to less than significant in the future.

Nevertheless, the proposed Project would result in population growth that would exceed the population growth anticipated for the City in SCAG's regional growth forecast, and therefore conflict with Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook. There is no feasible mitigation measure for population growth; therefore, this impact would be significant and unavoidable.

Cumulative Effect

Operation-Related Cumulative Impacts

The Project would result in less-than-significant long-term operational air quality impacts for all criteria pollutants. Impacts related to the proposed Project's potential to conflict with or obstruct implementation of the SCAQMD 2016 AQMP would be significant and unavoidable due to the exceedance of population projections assumed within SCAG's RTP/SCS. No feasible mitigation can be implemented for population growth.

2.2.1.2 Mitigation Measures

There is no feasible mitigation measure for population growth.

2.2.1.3 Findings per CEQA Guidelines

The City finds that there is no feasible mitigation measure to reduce the Project's air quality impact exceeding the assumptions in the AQMP. The proposed Project would not result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or conflict with Consistency Criterion No. 1. However, implementation of the proposed Project would exceed the demographic growth forecasts in the SCAG 2016 RTP/SCS; therefore, the proposed Project would potentially conflict with the SCAQMD 2016 AQMP. Based on these considerations, impacts related to the proposed Project's potential to conflict with or obstruct implementation of the applicable air quality plan would be significant and unavoidable, as no feasible mitigation can be implemented for population growth.

Pursuant to Section 21081(a)(3) of the California Public Resources Code, as described in the Statement of Overriding Considerations, the City has determined that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EIR, and the identified air quality impacts are thereby acceptable because of specific overriding considerations (see Section 5).

2.2.1.4 Facts in Support of the Findings Related to Air Quality

Considering the population growth anticipated in the 2016 RTP/SCS of 600 individuals within the City between 2012 and 2040, the proposed Project would result in a population growth that exceeds the growth assumptions in the 2016 RTP/SCS, and would thereby exceed the population growth assumptions in the AQMP. The proposed Project would therefore conflict with the applicable AQMP, which would result in a significant and unavoidable impact, as there is no feasible mitigation for population growth.

2.3 Impacts Determined to Be Less Than Significant with Mitigation

This section identifies significant adverse impacts of the Project that require findings to be made under CEQA Section 21081(a) and CEQA Guidelines Section 15091(a)(1). Based on substantial evidence, the City finds that adoption of the mitigation measures set forth in this section will reduce the identified significant impacts to less than significant levels:

Air Quality

- Expose Sensitive Receptors to Substantial Pollutant Concentrations
- Cumulative Effect

Cultural Resources

- Archaeological Resources
- Cumulative Effect

Geology and Soils

- Paleontological Resources
- Cumulative Effect

Hazards and Hazardous Materials

- Routine Transport, Use, or Disposal of Hazardous Materials/Release of Hazardous Materials and the Potential for Upset Conditions
- Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials
- Cortese List
- Emergency Response Plan

Noise

- Generation of Substantial Temporary or Permanent Increase in Ambient Noise Levels
- Cumulative Effect

Transportation

- Inadequate Emergency Access

Tribal Cultural Resources

- Historical Resources Register
- California Public Resource Code, Section 5024.1
- Cumulative Effect

Other impacts addressed under Air Quality, Cultural Resources, Geology and Soils, Hazards and Hazardous Materials, Noise, and Transportation are addressed under Section 2.4, Impacts Determined to Be Less Than Significant.

2.3.1 Air Quality

2.3.1.1 Potentially Significant Impacts to Air Quality

Expose Sensitive Receptors to Substantial Pollutant Concentrations

Toxic Air Contaminants

Health Impacts of Toxic Air Contaminants

"Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period would contract cancer based on the use of standard Office of Environmental Health Hazard Assessment (OEHHA) risk assessment methodology (OEHHA 2015). TACs that would potentially be emitted during construction activities would be DPM emitted from heavy-duty construction equipment and heavy-duty trucks. Heavy-duty construction equipment and diesel trucks are subject to CARB Airborne Toxic Control Measures to reduce DPM emissions. According to the OEHHA, HRAs should be based on a 30-year exposure duration based on typical residency period; however, such assessments should be limited to the period/duration of activities associated with a project (OEHHA 2015). The results of the HRA demonstrate that the TAC exposure from construction diesel exhaust emissions would result in an on-site cancer risk above the 10 in 1 million threshold for the proposed Project. The Chronic Hazard Index for the proposed Project would be less than 1. Therefore, TAC emissions from construction activities associated with the proposed Project may expose sensitive receptors to substantial pollutant concentrations of TACs and would result in a potentially significant impact; therefore, mitigation measure MM-AQ-1 is required. The HRA results from the mitigated scenario show cancer risks less than the 10 in 1 million threshold and chronic hazard index less than the 1.0 threshold. Impacts would be less than significant with mitigation incorporated.

Cumulative Effect

Construction-Related Cumulative Impacts

Construction of the Project is not expected to exceed the SCAQMD mass daily emission-based construction thresholds. In addition, construction of the Project would not exceed the SCAQMD's LST and would not result in impacts to potential nearby sensitive receptors. The Project's short-term construction-related TAC emissions would not result in a significant health risk and would not substantially contribute to health risk in the Project area with implementation of MM-AQ-1, which would reduce Project-related health risk on nearby sensitive receptors by substantially reducing exhaust diesel particulate matter (DPM). MM-AQ-1 would also reduce potentially significant construction-related cumulative impacts. Because of the minimal amount of Project-related emissions relative to significance thresholds, and because of compliance with SCAQMD rules, Project-generated construction emissions would not be cumulatively considerable.

2.3.1.2 Mitigation Measures

MM-AQ-1 To reduce the potential for criteria air pollutants, specifically particulate matter (PM), as a result of construction of the Project, the Construction Contractor's contract specifications shall require compliance with the following:

Prior to the start of construction activities, the Construction Contractor shall ensure that all 75 horsepower or greater diesel-powered equipment are powered with California Air Resources Board (CARB)-certified Tier 4 Interim engines. An exemption from this requirement may be granted if equipment with Tier 4 Interim engines are not reasonably available and the required corresponding reductions in criteria air pollutant emissions can be achieved from other combinations of construction equipment, such as using equipment with Tier 4 Final engines. Before an exemption may be granted, the City's Construction Contractor shall: (1) demonstrate that at least two construction fleet owners/operators in Los Angeles County were contacted and that those owners/operators confirmed Tier 4 Interim equipment could not be located within Los Angeles County during the desired construction schedule; and (2) the proposed replacement equipment has been evaluated using CalEEMod and documentation provided to the City to confirm that Project-generated emissions do not exceed applicable localized significance thresholds (LST) for nitrogen dioxide (NO_2), carbon monoxide (CO), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), and particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and the SCAQMD carcinogenic (cancer) risk threshold. If these requirements cannot be met, construction activities at the Project site shall be postponed until CARB-certified Tier 4 Interim engines are available for use.

2.3.1.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), a feasible measure that can minimize significant adverse impacts was developed for the potentially significant impacts described in Section 2.3.1.1. This feasible measure, MM-AQ-1, is listed in Section 2.3.1.2.

The City finds that this mitigation measure is feasible, is adopted, and will reduce the potential air quality impacts of the Project to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the Project that mitigate or avoid potentially significant air quality impacts of the Project identified in the EIR.

2.3.1.4 Facts in Support of the Findings Related to Air Quality

The construction of the proposed Project would result in a potentially significant pollutant concentration of TACs prior to mitigation. With the implementation of MM-AQ-1, the emissions of DPM would be significantly reduced compared to the unmitigated scenario, impacts would be less than significant after mitigation. There would be no significant, unavoidable impacts related to air quality after implementation of this mitigation measure.

2.3.2 Cultural Resources

2.3.2.1 Potentially Significant Impacts to Cultural Resources

Archaeological Resources

The CHRIS records search identified 33 previously conducted cultural resources technical investigations within the 1-mile radius records search area. Of these, one study overlaps the Project site; however, individual sites were not identified within the current Project site as a result of this study. Additionally, the SCCIC records indicate that 12 previously recorded cultural resources exist within the surrounding 1-mile search radius. All of the resource

identified are built environment resources. No previously recorded prehistoric or historic-era archaeological resources were identified within the Project site or 1-mile records search radius. Additionally, the NAHC was contacted to request a search of its SLF, which were negative. The NAHC also suggested contacting five Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources in or near the Project site.

Based on the results provided above, the potential of encountering and impacting unknown archaeological resources during Project implementation is low given the level of disturbance from the mid-twentieth century; however, it is always possible that unanticipated discoveries could be encountered during ground-disturbing activities associated with the proposed Project. If such unanticipated discoveries were encountered, impacts to encountered resources could be potentially significant. However, with implementation of Mitigation Measure (MM-) CUL-1, which includes preparation and implementation of a Worker Environmental Awareness Program (WEAP), all construction personnel will be appropriately informed of required responses to unanticipated cultural resources, should these be encountered. Additionally, MM-CUL-2, requires that all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, can evaluate the significance of the find. Thus, potentially significant impacts to archaeological resources would be reduced to less-than-significant levels with mitigation incorporated.

Cumulative Effect

For archaeological resources, cumulative projects may require extensive excavation in culturally sensitive areas, and thus, may result in adverse effects to known or previously unknown, inadvertently discovered archaeological resources. There is the potential for accidental discovery of other archaeological resources by the proposed Project as well as by cumulative projects. Because all significant cultural resources are unique and non-renewable, all adverse effects or negative impacts contribute to a dwindling resource base. Through implementation of MM-CUL-2, which would require investigation and handling by a qualified archaeologist in the event that an unknown resource is encountered, the project-level impact to archeological resources would be reduced to less than significant.

Other individual projects occurring in the vicinity of the Project site would also be subject to the same requirements of CEQA as the proposed Project and any impacts to archaeological resources would be mitigated, as applicable. These determinations would be made on a case-by-case basis, and the effects of cumulative development on historical and archaeological resources would be mitigated to the extent feasible in accordance with CEQA and other applicable legal requirements. Therefore, impacts on archaeological resources would not be cumulatively considerable with mitigation incorporated (MM-CUL-2).

2.3.2.2 Mitigation Measures

MM-CUL-1 Prior to commencement of construction activities for all phases of Project implementation, the Project applicant shall retain a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, to prepare a Worker Environmental Awareness Program (WEAP). The WEAP shall be submitted to the City of El Segundo for review and approval. All construction personnel and monitors shall be presented the WEAP training prior to the start of construction activities. The WEAP shall be prepared to inform all personnel working on the proposed Project about the archaeological sensitivity of the area, to provide specific details on the kinds of archaeological materials that may be identified during construction, to explain the importance of and legal basis for the protection of significant archaeological resources, and to outline the actions to be

taken in the event of a discovery of cultural resources. The WEAP shall define "tribal cultural resources" and include appropriate management requirements relating to inadvertent discovery of a potential tribal cultural resource. Each worker shall also learn the proper procedures to follow in the event that cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor and archaeological monitor.

MM-CUL-2 If potential archaeological resources (i.e., sites, features, or artifacts) are exposed during construction activities for the proposed Project, the City shall be notified and all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, can evaluate the significance of the find and determine whether or not additional study is warranted. The archaeologist shall be empowered to temporarily stop or redirect grading activities to allow removal of abundant or large artifacts. Depending upon the significance of the find under the California Environmental Quality Act (CEQA) (14 CCR 15064.5[f]; PRC, Section 21082), the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under CEQA, additional work, such as preparation of an archaeological treatment plan and data recovery, may be warranted. The archaeologist shall also be required to curate any discovered specimens in a repository with permanent retrievable storage and submit a written report to the City of El Segundo for review and approval prior to occupancy of the first building on the site. Once approved, the final report shall be filed with the South Central Coastal Information Center (SCCIC).

2.3.2.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described in Section 2.3.2.1. These feasible measures, MM-CUL-1 and MM-CUL-2, are listed in Section 2.3.2.2.

The City finds that these mitigation measures are feasible, are adopted, and will reduce the potential cultural resources impacts of the Project to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in or incorporated into the Project that will mitigate or avoid potentially significant impacts on cultural resources.

2.3.2.4 Facts in Support of the Findings Related to Cultural Resources

Implementation of MM-CUL-1 and MM-CUL-2 would reduce potentially significant impacts to archaeological resources by addressing the inadvertent discovery of archeological resources. There would be no significant, unavoidable impacts related to cultural resources after implementation of this mitigation measure.

2.3.3 Geology and Soils

2.3.3.1 Potentially Significant Impacts to Geology and Soils

Paleontological Resource

The Project site is underlain late Pleistocene Sand Dune deposits as indicated by surficial geological mapping at a 1:24,000 scale and is not anticipated to be underlain by unique geological features. The LACM did not report any paleontological localities from within the Project site, but they did report localities nearby from Pleistocene Sand Dune deposits. In addition to the LACM localities, desktop research for the Project area indicated there are additional paleontological localities from Pleistocene Sand Dune deposits close to the Project site. Given the proximity of past fossil discoveries in the surrounding area and the potential for significant vertebrate fossils below any artificial fill present within the Project site, the proposed Project is highly sensitive for supporting paleontological resources and is considered to have high paleontological sensitivity. In the event that intact paleontological resources are located on the Project site, ground-disturbing activities associated with construction of the Project, such as grading during site preparation, excavations for the subterranean parking structure, and trenching for pipelines or utilities, have the potential to destroy a unique paleontological resource or site. Without mitigation, the potential damage to paleontological resources during construction would be a potentially significant impact. However, upon implementation of Mitigation Measure (MM)-GEO-1, impacts would be reduced to below a level of significance. MM-GEO-1 requires a preparation of a Paleontological Resources Impact Mitigation Program that requires preconstruction meeting attendance and worker environmental awareness training, where monitoring is required within the Project site below a depth of 5 feet below the existing ground surface or depth of documented artificial fill (based on construction plans and/or geotechnical reports), procedures for adequate paleontological monitoring and discoveries treatment, and paleontological methods (including sediment sampling for microvertebrate fossils), reporting, and collections management. With incorporation of MM-GEO-1, impacts would be less than significant.

Cumulative Effect

Potential cumulative impacts on geology and soils would result from projects that combine to create geologic hazards, including unstable geologic conditions, or contribute substantially to erosion. The majority of impacts from geologic hazards, such as rupture of a fault line, liquefaction, landslides, expansive soils, and unstable soils, are site-specific and are therefore generally mitigated on a project-by-project basis. Each cumulative project would be required to adhere to required building engineering design per the most recent version of the CBC in order to ensure the safety of building occupants and avoid a cumulative geologic hazard. Additionally, as needed, projects would incorporate individual mitigation or geotechnical requirements for site-specific geologic hazards present on each individual cumulative project site. Similarly, MM-GEO-1 would ensure that potential impacts to paleontological resources would be less than significant and other cumulative projects that would have a potential to impact soils that are sensitive for significant fossils would also require mitigation. Therefore, a potential cumulative impact related to site-specific geologic hazards, such as seismically induced ground failure, subsidence, soil collapse, and expansive soils, as well as paleontological resources, would not occur. Therefore, the proposed Project, in combination with other cumulative projects, would not contribute to a significant cumulative impact associated with geology and soils.

2.3.3.2 Mitigation Measures

MM-GEO-1 Prior to commencement of any grading activity on-site, the Project applicant/developer shall retain a qualified paleontologist per the Society of Vertebrate Paleontology (SVP) (2010) guidelines. The paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) for the Project for review and approval by the City. The PRIMP shall be consistent with the SVP (2010) guidelines and shall outline requirements for preconstruction meeting attendance and worker environmental awareness training, where monitoring is required within the Project site below a depth of 5 feet below the existing ground surface or depth of documented artificial fill (based on construction plans and/or geotechnical reports), procedures for adequate paleontological monitoring and discoveries treatment, and paleontological methods (including sediment sampling for microvertebrate fossils), reporting, and collections management. At a minimum, the PRIMP shall require that a qualified paleontologist attend the preconstruction meeting and a qualified paleontological monitor be on-site during all rough grading and other significant ground-disturbing activities (including augering) in previously undisturbed, Pleistocene Sand Dune deposits. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the PRIMP shall require that a paleontological monitor temporarily halt and/or divert grading activity to allow recovery of paleontological resources.

2.3.3.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), a feasible measure that can minimize significant adverse impacts was developed for the potentially significant impacts described in Section 2.3.3.1. This feasible measure, MM-GEO-1, is listed in Section 2.3.3.2.

The City finds that this mitigation measure is feasible, is adopted, and will reduce the potential paleontological resources impacts of the Project to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the Project that mitigate or avoid potentially significant paleontological -related impacts of the Project identified in the EIR.

2.3.3.4 Facts in Support of the Findings Related to Geology and Soils

Potential impacts to geology and soils would be less than significant. Incorporation of MM-GEO-1 would reduce construction-related impacts to paleontological resources to a less-than-significant level. There would be no significant, unavoidable impacts related to geology and soils after implementation of these mitigation measures.

2.3.4 Hazards and Hazardous Materials

2.3.4.1 Potentially Significant Impacts to Hazards and Hazardous Materials

Routine Transport, Use, or Disposal of Hazardous Materials/Release of Hazardous Materials and the Potential for Upset Conditions

Short-Term Construction Impacts

Construction would require the use of heavy equipment and machinery. Hazardous materials would be stored in designated construction staging areas within the boundaries of the Project site and the construction contractor must ensure that they would be transported, handled, used, stored, and disposed of in accordance with all applicable federal, state, and local laws and regulations.

The Food and Beverage Building is scheduled for demolition as part of the proposed Project. Based on information provided in the Phase I ESA, ACM is present, and LBP and universal wastes are likely present in the Food and Beverage Building. Universal wastes that may be present would require collection and off-site disposal prior to demolition. Hazardous wastes, such as spent chemicals or petroleum, may also require collection and off-site disposal prior to demolition and rehabilitation. Additionally, materials that contain PCBs would require proper management prior to demolition. Should remaining hazardous materials and hazardous wastes associated with site maintenance be present, including petroleum products and cleaning supplies, these would be disturbed during the demolition process if not removed. These materials, if not properly removed, could be transported offsite with demolition debris, and therefore the proposed Project has the potential to create a significant hazard to the public or the environment through the routine transport or disposal of hazardous materials associated with demolition activities. In accordance with mitigation measure (MM-)HAZ-1, demolition must include abatement of the Food and Beverage Building of any asbestos- and lead-containing materials, PCB-containing items, universal wastes, and/or other hazardous materials. Abatement must be conducted by licensed contractors, and materials must be transported offsite for recycling and/or disposal by licensed transporters in accordance with federal, state, and local laws. Hazardous materials are also present in the hotels, including a diesel AST and various janitorial items. As these hotels are not scheduled for demolition or renovation for the proposed Project, it is not anticipated that the presence of these materials would impact construction of the proposed Project. With implementation of MM-HAZ-1, impacts associated with the routine transport of ACM, LBP, universal wastes, and hazardous materials for offsite disposal during construction would be less than significant with mitigation incorporated.

Reasonably Foreseeable Upset and Accident Conditions

Short-Term Construction Impacts

The proposed Project has the potential to expose the public and the environment to hazards associated with on-site releases of hazardous materials including ACM, LBP, PCB-containing items, universal wastes, and other hazardous materials and wastes present in the building scheduled for demolition. Management of hazardous materials and waste during pre-demolition surveys and abatement activities would be addressed by MM-HAZ-1.

Five hazardous material pipelines are located within close proximity to the Project site, three of which are located within the PCH right-of-way. Construction of the proposed Project would require excavation into existing rights-of-way to connect to existing utilities. In accordance with California Government Code 4216, notification to the Regional Notification Center is required prior to excavation work so that subsurface utilities can be located.

Excavation, grading, and offsite export of soils is anticipated for construction of the proposed Project. The adjacent 76 gasoline service station suggest that there is a potential for soil contamination associated with gas station operations in this area. Excavation of petroleum-impacted soils could cause an upset or accident condition if contaminated soils are released to the environment. Therefore, MM-HAZ-2 requires preparation of a Hazardous Materials Contingency Plan, which would include procedures to identify, handle, and dispose of potential petroleum-impacted soils related to the gas station.

With adherence to federal, state, and local laws and regulations, and implementation of MM-HAZ-1 and MM-HAZ-2, short-term construction impacts associated with potential upset and accident conditions involving the release of hazardous materials to the environment would be less than significant with mitigation incorporated.

Cortese List

Short-Term Construction Impacts

A search of the Cortese List databases was conducted, as well as other online environmental regulatory databases that provide information on hazardous material release sites in the State of California. Multiple LUST sites were identified within 0.5-mile of the Project site. These LUST sites have all received regulatory closure. However, as discussed above in Off-Site Hazardous Materials, one of these sites still has potential remaining contamination which could impact the Project site. No additional sites were identified on the Cortese List databases within 1 mile of the Project site. Additionally, 3 hazardous material release sites were identified that were not previously identified in the Phase I ESA; upon review these sites are at such a distance or gradient and/or have limited environmental contamination such that they do not likely impact the environmental condition of the Project site.

There are three sites within 0.5-mile of the Project site that have documented contamination: (1) 76 Station at 603 N Pacific Coast Highway (Sepulveda Boulevard), (2) the West Basin groundwater, and (3) a regional PCE and TCE groundwater contamination plume. Excavation and grading of PCC-North would occur adjacent to the gas station. Therefore, there is a potential for petroleum-impacted soils to be present in excavations adjacent to the gas station. A Hazardous Materials Contingency Plan would be prepared in accordance with MM-HAZ-2, which would include procedures to identify, handle, and dispose of potential petroleum-impacted soils related to the gas station. The other two listings are associated with groundwater contamination. Groundwater is not expected to be encountered during construction activities. Therefore, construction of the proposed Project in areas of potentially impacted groundwater is not anticipated to create a significant hazard to the public or the environment. With implementation of MM-HAZ-2, short-term construction related impacts associated with nearby hazardous materials sites would be less than significant with mitigation incorporated.

Impair or Interfere with an Adopted Emergency Response Plan or Emergency Evacuation Plan

Short-Term Construction Impacts

PCH is a designated emergency evacuation route and runs north/south adjacent to the Project site. Construction of the proposed Project is not anticipated to impact traffic routes on PCH or other adjacent streets. However, should construction of the proposed Project require partial right-of-way closures, such as when tying into existing utilities, a traffic control plan would be submitted in accordance with MM-TRA-1. The traffic control plan would provide alternative routes for emergency evacuation and would be submitted to and approved by the City of El Segundo and/or California Department of Transportation. With implementation of MM-TRA-1, impacts would be less than significant with mitigation incorporated.

2.3.4.2 Mitigation Measures

MM-HAZ-1 The Project applicant/developer shall ensure that the demolition contractor's contract specifications incorporate abatement procedures for the removal of materials containing asbestos, lead, polychlorinated biphenyls, hazardous material, hazardous wastes, and universal waste items. Confirmation of adequate removal of such materials shall be provided to the City prior to the issuance

of a building permit for PCC-Fairfield Parking. All abatement work shall be done in accordance with federal, state, and local regulations, including those of the U.S. Environmental Protection Agency (which regulates disposal), Occupational Safety and Health Administration, U.S. Department of Housing and Urban Development, California Occupational Safety and Health Administration (which regulates employee exposure), and the South Coast Air Quality Management District.

MM-HAZ-2 Prior to commencement of any earthwork or construction activities at PCC-North, a Hazardous Materials Contingency Plan (HMCP) shall be developed that addresses potential impacts in soil and soil vapor associated with the 76 Station adjacent to PCC-North. The HMCP shall include training procedures for identification of contamination, and shall describe procedures for assessment, characterization, management, and disposal of hazardous constituents, materials, and wastes, and notification in accordance with all applicable state and local regulations. Contaminated soils shall be managed and disposed of in accordance with local and state regulations. The HMCP shall include health and safety measures, which may include but are not limited to periodic work breathing zone monitoring and monitoring for volatile organic compounds using a handheld organic vapor analyzer in the event impacted soils are encountered during excavation activities. The applicant or its designee shall implement the HMCP during construction activities for the proposed Project.

2.3.4.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described in Section 2.3.4.1. These feasible measures, MM-HAZ-1 and MM-HAZ-2, are listed in Section 2.3.4.2.

The City finds that these mitigation measures are feasible, are adopted, and will reduce the Project's potential impacts related to hazards and hazardous materials to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in or incorporated into the Project that will mitigate or avoid potentially significant impacts related to hazards and hazardous materials.

2.3.4.4 Facts in Support of the Findings Related to Hazards and Hazardous Materials

The abatement of hazardous materials identified on the Project site would remove the potential for exposure of the public and the environment to accidental release of hazardous materials, as required by MM-HAZ-1. Construction and demolition activities on PCC-North adjacent to the adjacent 76 Station would be completed in accordance with the Hazardous Materials Contingency Plan, as required by MM-HAZ-2, Therefore, impacts related to foreseeable upset and accident conditions involving a release of hazardous materials to the environment would be mitigated to a less-than-significant level. All other impacts would be less than significant. There would be no significant, unavoidable impacts related to hazards and hazardous materials after implementation of these mitigation measures.

2.3.5 Noise

2.3.5.1 Potentially Significant Impacts to Noise

Generation of a Substantial Temporary or Permanent Increase in Ambient Noise Levels

Construction Noise (Short-Term Impacts)

Construction noise and vibration are temporary phenomena. Construction noise and vibration levels vary from hour to hour and day to day, depending on the equipment in use, the operations performed, and the distance between the source and receptor. The estimated construction noise levels are predicted to be as high as 85 dBA hourly L_{eq} at the nearest existing residences when Project Buildout Phase 2 (PCC-North) grading activities take place. Aside from operation of an air compressor at the acoustical center of buildout Phases 1 and 3, noise from construction for all phases is anticipated to exceed the City's hourly threshold of 65 dBA L_{eq} at the existing nearest residential properties to the west. Thus, under these conditions construction noise would result in a temporary but significant noise impact at these receptors and require mitigation measures that—if designed and implemented properly by the Project applicant and its construction contractors—would need to demonstrate at least 5 dBA and as high as 20 dBA of sound abatement in order to yield Project-attributed construction noise levels that are compliant with this City standard. Typical construction "sound blankets", such as those offered by local suppliers, are capable of providing this 5 to 20 dBA range of acoustical insertion loss (i.e., the difference in measured sound level at a receiver after a sound-occluding element is placed in the direct path between the receiver and the noise source of interest). Thus, with application of MM-NOI-1, construction noise impacts at the nearest multi-family residential properties on the west side of Indiana Street and west side of Phase 2 (PCC-North) would be reduced to a less than significant level.

Cumulative Effect

Noise in Excess of Standards

Implementation of the Project and its component site-specific development, as well as unrelated development projects within its vicinity would all be subject to applicable noise standards. The Project would not contribute to cumulative exceedances of noise standards, and its incremental effect would be a less-than-significant impact with mitigation incorporated.

2.3.5.2 Mitigation Measures

MM-NOI-1 Prior to issuance of a demolition or grading permit, whichever occurs first, the Project Applicant/Developer or its approved construction contractor shall develop and submit to the City of El Segundo a Construction Noise Mitigation Plan (CNMP) for review and approval. The CNMP shall include, at a minimum, the following noise reduction means and related measures:

a. To protect the existing occupied residences on the west side of Indiana Street (and west of the PCC North (Phase 2) portion of the Project, between E. Mariposa Avenue and E. Palm Avenue) from excessive Project construction-related noise attributed to demolition, site preparation, grading, building construction, and paving activities during PCC-Fairfield Parking (Phase 1) and PCC-South (Phase 3), and those same five activities plus architectural coating activities during

Phase 2, temporary noise barriers of sufficient height and extent along the Project's western site boundary shall be installed and shall be confirmed to achieve (depending on construction phase activity and involved equipment) at least 5 dBA and as much as 20 dBA of barrier noise insertion loss. The temporary barrier elements should resemble an outdoor-use vinyl-covered acoustical blanket comprising one or more materials that demonstrate a sound transmission class (STC) of 30 or better. The Project Applicant/Developer shall retain the services of a qualified acoustical consultant or noise control engineer to advise on or review the design, installation, and expected performance of such temporary barriers when used during Project construction. Anticipated locations, horizontal extents, heights, and durations of installation of the temporary sound barriers over the course of Project phased buildout shall be part of the CNMP submitted to the City for review.

b. Operation of a concrete saw during the demolition phase shall include some form of proximate and portable solid-walled partial enclosure, acoustical-blanket tent, or comparably-performing shroud that can reliably deliver 10 dBA of noise reduction—separate from the temporary barrier insertion loss need described in MM-NOI-1(a) above. Alternately, slotted low-noise saw blades may be used to yield some or all of this noise reduction, so that operation of the concrete saw at a distance of 50 feet does not exceed 80 dBA. If this limit cannot be wholly achieved due to saw operation noise control or localized sound abatement (i.e., partial enclosure), then the balance of needed attenuation shall be provided by either the temporary noise barrier per MM-NOI-1(a) or by limiting duration of saw operation within an hour: each halving of duration should yield a 3 dB reduction to the hourly noise level produced by the saw.

c. Residents within 200 feet of the Project shall be informed at least two (2) weeks in advance when construction phase activities will occur. An information telephone hotline and/or website shall be established and managed to receive resident complaints, and the Applicant and its contractors shall respond to received complaints and document their investigations and any complaint resolutions in regular reports to the City Building Safety division.

2.3.5.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), a feasible measure that can minimize significant adverse impacts was developed for the potentially significant impacts described in Section 2.3.5.1. This feasible measure, MM-NOI-1, is listed in Section 2.3.5.2.

The City finds that this mitigation measure is feasible, is adopted, and will reduce potential noise impacts of the Project to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in or incorporated into the Project that will mitigate or avoid potentially significant noise impacts.

2.3.5.4 Facts in Support of the Findings Related to Noise

With implementation of MM-NOI-1 prior to and during construction of the Project, potential construction noise impacts as received at the nearest residential properties would be reduced to less-than-significant levels. There would be no significant, unavoidable impacts related to noise after implementation of this mitigation measure.

2.3.6 Transportation

2.3.6.1 Potentially Significant Impacts to Transportation

Inadequate Emergency Access.

Construction

Short-Term Site Access

Short-term adverse traffic and parking impacts could occur in the Project vicinity during construction of the Project. Additional trips generated by the truck deliveries and construction employees could affect traffic flow in the study area; construction activity could impact traffic near the Project site; and pedestrian traffic flow near the Project site could also be altered as a result of construction.

Based on the construction period trip generation analysis conducted for the proposed Project, the peak construction activity is estimated to generate fewer total daily trips and peak-hour trips than are projected for the Project once it is completed and occupied. Although the influx of equipment and materials to the Project site could create temporary adverse effects to the adjacent roadway, potential impacts associated with construction of the Project would be limited to those locations immediately adjacent to the Project site. Segments of PCH and Mariposa Avenue would have short-term impacts at locations where new curbs are installed. Temporary lane closures around the Project site may be expected. The existing hotels on the Project site would remain open during the duration of construction. Pedestrian access to the existing hotel uses on the Project site would be open, although temporary sidewalk closures around the portions of the Project site may be expected, specifically during Mariposa Avenue street improvements for approximately 1 to 2 months.

These construction activities have the potential to temporarily impact emergency vehicle access to the Project site. To ensure adequate safeguards for pedestrian, bicycle and vehicular circulation and emergency vehicle access during short-term construction activities, MM-TRA-1 is required. MM-TRA-1 requires preparation of a Construction Traffic Control Plan. With implementation of MM-TRA-1 to address pedestrian, bicycle, and vehicular circulation during construction activities, would reduce potential impacts related to emergency access to less than significant.

2.3.6.2 Mitigation Measures

MM-TRA-1 Prior to the issuance of demolition or grading permits, the Project applicant/developer shall develop and implement a City-approved Construction Traffic Control Plan. The Plan shall be prepared in accordance with applicable City and Manual on Uniform Traffic Control Devices guidelines and shall address the potential for construction-related vehicular traffic, as well as pedestrian and bicycle circulation disruption in the public right-of-way. The Plan shall describe safe detours and shall include protocols for implementing the following, if determined necessary and feasible: temporary traffic controls (e.g., a flag person) during construction to maintain smooth traffic flow; dedicated turn lanes for movement of construction trucks and equipment on and off site; scheduling of construction activities that affect traffic flow on the arterial system to off-peak hours; consolidation of truck deliveries; and/or rerouting of construction trucks away from congested streets or sensitive receptors.

2.3.6.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), a feasible measure that can minimize significant adverse impacts was developed for the potentially significant impacts described in Section 2.3.6.1. This feasible measure, MM-TRA-1, is listed in Section 2.3.6.2.

The City finds that this mitigation measure is feasible, is adopted, and will reduce the potential transportation-related impacts of the Project to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in or incorporated into the Project that will mitigate or avoid potentially significant impacts related to transportation.

2.3.6.4 Facts in Support of the Findings Related to Transportation

With incorporation of MM-TRA-1, potential significant impacts related to short-term access to the Project site would be reduced to less than significant. All other potential environmental impacts to Transportation would be less than significant. There would be no significant, unavoidable impacts related to transportation after implementation of this mitigation measure.

2.3.7 Tribal Cultural Resources

2.3.7.1 Potentially Significant Impacts to Tribal Cultural Resources

Register of Historical Resources and Public Resource Code Section 5024.1

Observation of the present conditions within the proposed Project site indicate that all areas have been disturbed from urban development. Neither a California Historical Resources Information System records search nor survey were able to identify any archaeological resources within the Project site. An NAHC Sacred Lands File search did not identify Native American resources within the search area, which included the proposed Project site and a surrounding 1-mile buffer. The NAHC recommended contacting five Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources in or near the Project site.

- Andrew Salas, Chairperson, Gabrieleno Band of Mission Indians, Kizh Nation
- Anthony Morales, Chairperson, Gabrieleno/Tongva San Gabriel Band of Mission Indians
- Sandonne Goad, Chairperson, Gabrielino/Tongva Nation
- Robert Dorame, Chairperson, Gabrielino Tongva Indians of California Tribal Council
- Charles Alvarez, Gabrielino-Tongva Tribe

Pursuant to California Assembly Bill (AB) 52 and Senate Bill (SB) 18, the City of El Segundo contacted the five NAHC Native American individuals and/or tribal organizations provided on May 18, 2020. The Gabrieleno Band of Mission Indians, Kizh Nation, responded on May 29, 2020, affirming the Project lies within their Ancestral Tribal Territory and requested formal consultation with the City of El Segundo. During a subsequent consultation meeting on August 13, 2020 between the Kizh Nation and City, the Kizh Nation provided information including historical maps showing the limits early Spanish-Mexican era ranchos, the distribution of early travel routes, and approximate locations of mapped Native American village locations in the region. The City received email correspondence from the Kizh Nation on August 13th and August 27th in 2020 that further provided information relating to traditional use of the

area and documented villages located in what is now known as Playa Del Rey and Redondo Beach. Recommended mitigation was additionally provided by the Kizh Nation for City review. No Tribal Cultural Resources were identified within the proposed Project site by the Kizh Nation as a result of their formal consultation with the City. The City sent a follow-up email on September 10, 2020 acknowledging receipt of information provided by the Kizh Nation and noting the provided information along with the proposed mitigation measures would be considered during preparation of the Draft EIR. No further communication was received by the Kizh Nation. The City sent an email to Kizh Nation on October 1, 2020 to state consultation is considered complete.

No known tribal cultural resources or cultural resources were identified by the tribe that have potential to be impacted by project activities. Government to government tribal consultation pursuant to SB 18 and AB 52 has not resulted in the identification of a TCR within the Project site. Given that no TCR has been identified, no resource-specific mitigation measures pertaining to known TCRs have been developed. Based on this information, the City has determined that the Project would not cause a substantial adverse change in the significance of a tribal cultural resource with cultural value to a California Native American tribe pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1.

MM-CUL-1 requires preparation and implementation of a Worker Environmental Awareness Program (WEAP), wherein all construction personnel must be trained to respond appropriately to inadvertent discovery of cultural resources. Additionally, MM-CUL-2, requires that all construction work occurring within 100 feet of any potential archaeological discovery shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, evaluates the significance of the find, and any potentially significant impacts to resources. In consideration of the information provided by the Gabrieleno Band of Mission Indians, Kizh Nation, measures for appropriate management requirements in the event that unknown tribal cultural resources are inadvertently encountered during Project construction-related earthwork activities are outlined in the following MM-TCR-1. MM-TCR-1 requires that if potential tribal cultural resources are discovered through earthwork activities, the City shall be notified and coordination with Native American tribes that have been identified by the NAHC to be traditionally and culturally affiliated with the geographic area of the Project must be conducted. Any affected tribe would be provided a reasonable period of time to conduct a site visit and make recommendations regarding future ground disturbance activities as well as the treatment and disposition of any discovered tribal cultural resources. With incorporation of MM-TCR-1, as well as MM-CUL-1, and MM-CUL-2, impacts to tribal cultural resources would be less than significant.

Cumulative Tribal Cultural Resources Impacts

Cumulative impacts on tribal cultural resources consider whether impacts of the proposed Project together with other related projects identified within the vicinity of the Project site, when taken as a whole, substantially diminish the number of such resources within the same or similar context or property type. There are no known tribal cultural resources on the Project site and the area is considered to be of low potential to contain unanticipated cultural or tribal cultural resources. No archaeological resources have been documented by the SCCIC within the Project site or a surrounding one-mile records search area.

Other individual projects occurring in the vicinity of the Project site would also be subject to the same requirements of CEQA as the proposed Project and any impacts to tribal cultural resources would be mitigated, as applicable. These determinations would be made on a case-by-case basis, and the effects of cumulative development on historical and archaeological resources would be mitigated to the extent feasible in accordance with CEQA and other applicable legal requirements. Therefore, impacts on archaeological resources would not be cumulatively considerable with mitigation incorporated as MM-TCR-1, MM-CUL-1, and MM-CUL-2.

2.3.7.2 Mitigation Measures

MM-TCR-1 Should a potential tribal cultural resource (TCR) (as defined by PRC Section 21074) be inadvertently encountered during construction activities, consistent with the process required by MM-CUL-2, all construction work occurring within 100 feet of the find shall immediately stop and the City shall be notified of the discovery. The City shall notify Native American tribes that have been identified by the Native American Heritage Commission to be traditionally and culturally affiliated with the geographic area of the Project. Any affected tribe shall be provided a reasonable period of time to conduct a site visit and make recommendations regarding future ground disturbance activities as well as the treatment and disposition of any discovered TCRs. Depending on the nature of the potential resource and Tribal recommendations, review by a qualified archaeologist may be required. Implementation of proposed recommendations shall be made based on the determination of the City that the approach is reasonable and feasible.

MM-CUL-1 Prior to commencement of construction activities for all phases of Project implementation, the Project applicant shall retain a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, to prepare a Worker Environmental Awareness Program (WEAP). The WEAP shall be submitted to the City of El Segundo for review and approval. All construction personnel and monitors shall be presented the WEAP training prior to the start of construction activities. The WEAP shall be prepared to inform all personnel working on the proposed Project about the archaeological sensitivity of the area, to provide specific details on the kinds of archaeological materials that may be identified during construction, to explain the importance of and legal basis for the protection of significant archaeological resources, and to outline the actions to be taken in the event of a discovery of cultural resources. The WEAP shall define "tribal cultural resources" and include appropriate management requirements relating to inadvertent discovery of a potential tribal cultural resource. Each worker shall also learn the proper procedures to follow in the event that cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor and archaeological monitor.

MM-CUL-2 If potential archaeological resources (i.e., sites, features, or artifacts) are exposed during construction activities for the proposed Project, the City shall be notified and all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, can evaluate the significance of the find and determine whether or not additional study is warranted. The archaeologist shall be empowered to temporarily stop or redirect grading activities to allow removal of abundant or large artifacts. Depending upon the significance of the find under the California Environmental Quality Act (CEQA) (14 CCR 15064.5[f]; PRC, Section 21082), the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under CEQA, additional work, such as preparation of an archaeological treatment plan and data recovery, may be warranted. The archaeologist shall also be required to curate any discovered specimens in a repository with permanent retrievable storage and submit a written report to the City of El Segundo for review and approval prior to occupancy of the first building on the site. Once approved, the final report shall be filed with the South Central Coastal Information Center (SCCIC).

2.3.7.3 Findings per CEQA Guidelines

Consistent with CEQA Guidelines Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described in Section 2.3.7.1. These feasible measures, MM-TCR-1, as well as MM-CUL-1 and MM-CUL-2, are listed in Section 2.3.7.2.

The City finds that these mitigation measures are feasible, are adopted, and will reduce the potential tribal cultural resource impacts of the Project to less than significant levels. Accordingly, the City finds that, pursuant to CEQA Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1), changes or alterations have been required in or incorporated into the Project that will mitigate or avoid potentially significant impacts on tribal cultural resources.

2.3.7.4 Facts in Support of the Findings Related to Tribal Cultural Resources

With the implementation of MM-TCR-1, as well as MM-CUL-1 and MM-CUL-2, would reduce potential impacts to tribal resources to less than significant levels. There would be no significant, unavoidable impacts related to tribal cultural resources after implementation of these mitigation measures.

2.4 Impacts Determined to Be Less Than Significant

Based on the analysis contained in the EIR, the following issue areas have been determined to fall within the "less than significant impact" category for all thresholds: aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use, mineral resources, population and housing, public services, recreation, transportation, utilities and service systems, and wildfire.

Other impacts under air quality, cultural resources, geology and soils, hazards and hazardous materials, noise, transportation, and tribal cultural resources not addressed below are addressed in Section 2.2 and Section 2.3.

2.4.1 Aesthetics

Scenic Vistas

The Project site is currently developed and located within a highly urbanized, relatively flat portion of the City. As such, views from the Project site and in the vicinity of the Project site are not particularly scenic. The City's General Plan does not identify any officially designated scenic vistas within City boundaries (City of El Segundo 1992). Further, the County of Los Angeles's General Plan does not identify any officially designated scenic vistas for conservation purposes (County of Los Angeles 2014). The western boundary of the City includes 0.8 miles of Pacific Ocean shoreline; however, this area is not visible from the Project site. The views from the Project site are limited to existing urban development. Scenic resources visible from the regional Project area include the elevated terrain of the Santa Monica Mountains to the north, San Gabriel Mountains to the north/northeast, the Lakes at El Segundo Golf Course to the southeast, and the coastline and beaches to the west. However, these scenic resources are not visible from the Project site due to the distance and intervening development. Although open space at Washington Park and Freedom Park provide some valued viewshed within the proximity of the Project, the intervening residential uses prevent extensive views of the Project site from these parks. As such, although the Project would result in visual changes on the Project site due to increased intensity of use, these changes would not adversely affect a

scenic vista. In summary, due to the urban, developed character of the existing viewshed, the presence and proximity of existing nine- to 20-story developments along PCH, as well as existing topography in the area, the proposed Project would not have a substantial adverse effect to existing scenic views of the Santa Monica Mountains, San Gabriel Mountains, the coastline, or beaches, and no mitigation is required.

Scenic Resource Damage within a State Scenic Highway

There are currently no designated state scenic highways or eligible state scenic highways in the City of El Segundo. The nearest eligible scenic highway, Route 1, runs from Route 187 near the City of Santa Monica (approximately 6 miles northwest of the Project site), to Route 101 near El Rio in Ventura County. The nearest officially designated state scenic highway, Route 27 near the Topanga State Park, is located approximately 13.3 miles northwest of the Project site (Caltrans 2019). Due to distance, intervening terrain, and intervening development, the proposed Project would not be visible from the eligible state scenic segment of Route 1 nor the officially designated state scenic highway segment of Route 27. As such, the proposed Project would not damage scenic resources within a state scenic highway. No impact would occur and no mitigation is required.

Regulations Governing Scenic Quality

California Public Resources Code Section 21071 defines an "urbanized area" as "(a) an incorporated city that meets either of the following criteria: (1) Has a population of at least 100,000 persons, or (2) Has a population of less than 100,000 persons if the population of that city and not more than two contiguous incorporated cities combined equals at least 100,000 persons." The combined population of the City of El Segundo and any combination of not more than two of these adjacent cities is well over 100,000 persons.

With regards to local plans and policies, under existing conditions, the Project site is subject to the El Segundo General Plan and the ESMC. The Project would involve adoption of the proposed Specific Plan, which would establish a new regulatory framework within the Specific Plan area. Implementation of the Project would require approval of a General Plan Amendment (No. GPA 19-01) to change the Land Use Designation from "General Commercial" and "Parking" to "Pacific Coast Commons Specific Plan (PCCSP)" with an accompanying General Plan Amendment Land Use map change (No. GPA 19-01), a Zone Text Amendment (No. ZTA 19-08) to add a new ESMC §15-3-2(A)(12) "Pacific Coast Commons Specific Plan (PCCSP)", and Zone Change (No. ZC-19-01).

The proposed Specific Plan would allow for the existing Aloft Hotel and Fairfield Inn and Suites Hotel properties to be in compliance with the Specific Plan as the hotels would be consistent with the newly established development standards in the Commercial-1 (COM-1) and Commercial-2 (COM-2), respectively. The COM-1 and COM-2 designations would allow hotels and several other commercial uses that are either accessory to hotel uses or complementary uses. Additionally, there would be no additional floor area added to the hotel properties.

Upon Project approval, the Specific Plan would constitute the zoning for the Project site, and the land use and development standards identified in the Specific Plan document would supersede all zoning regulations to the extent that they would be in conflict with the sections of this Specific Plan.

It is anticipated that Project implementation would eliminate all landscaped areas, including all trees, within the development areas that contain landscaping (PCC-South and PCC-Fairfield Parking), and no changes to landscaping are anticipated at the two hotel properties. As required by ESMC Section 9-3-6 all tree removals located on public property must obtain a tree permit from the City. Permits may be granted if the proposed tree removal would occur under the direction of a certified arborist and completed by a licensed contractor, and tree removal or maintenance

must adhere to standards issued by the International Society of Arboriculture. The City may require that the permittee plant another tree in the place of the one removed or destroyed and that a particular species of tree, as determined by the city's approved street tree list, be used as a replacement (and the director will select the species of tree that may be planted).

Additionally, the Specific Plan requires preparation of a Landscape Master Plan for each sub-district of the Specific Plan area to ensure a unified appearance implementing the intent of the Design Guidelines and objectives of this Specific Plan. The Landscape Master Plan must be prepared by a licensed landscape architect and it must be submitted to the City prior to approval of the first site plan review within the Specific Plan area. Development on the Project site must include landscaping at all property perimeter areas except where buildings, driveways, pedestrian walkways, driveway visibility and corner clearance areas are located. One shade tree must be provided for every 25 feet of street frontage where landscaping is provided. One shade tree must be provided for every 25 feet along interior property lines where landscaping is provided in the PCC Mixed-Use 2 (PCC MU-2) land use district. Therefore, the removal of any trees on the Project site would be addressed through compliance with the ESMC and the Specific Plan development standards.

Although the Project would require a General Plan Amendment to allow for greater density on the Project site, as well as changes to the allowable land use mix and land use recommendations for the site, the Project would comply with all other applicable goals and policies related to aesthetics and scenic resources of the City's General Plan.

The Project site would be brought into consistency with the ESMC upon approval of the Specific Plan and would comply with other applicable provisions of the ESMC. Additionally, the proposed Project is subject to the City's Site Plan Review, which would evaluate the proposal for architectural design. Therefore, the proposed Project would be consistent with applicable regulations governing scenic quality. Impacts would be less than significant, and no mitigation is required.

Shade/Shadow Effects

The Conceptual Site Plan proposes development that does not exceed the maximum allowable development capacity for each land use district as required by the Specific Plan. As such, the maximum allowable height as defined by the Specific Plan is more conservative for its potential shade/shadow impacts. The maximum allowable height for each of the Specific Plan land use districts are listed in Section 4.1.2, Relevant Plans, Policies, and Ordinances. No development changes are proposed to PCC-COM-1 and PCC-COM-2. The development standards in the Specific Plan identify the maximum height for PCC-MU-1 (PCC-South) as 90 feet, PCC-COM-3 (PCC-Fairfield Parking) as 68 feet, and PCC-MU-2 (PCC-North) as 85 feet.

The existing residential across Indiana Street to the west, are considered shadow-sensitive uses. A shade/shadow analysis was prepared for the proposed Project to consider the potential for shadow-sensitive uses to be placed in shadow by the Project. To approximate shade and shadow conditions in the surrounding area created by implementation of the proposed Project, shadows cast by the proposed Project were simulated for the winter solstice (December 21), spring equinox (March 20), summer solstice (June 21), and fall equinox (September 23) Shadow projections from the proposed Project during spring, summer, winter, and fall.

The City does not have existing zoning or other regulations governing the effects of shade/shadow. Nonetheless, the City has utilized the City of Los Angeles thresholds of significance to determine whether the proposed Project would result in a significant to shade/shadow impacts onto adjacent residential uses. Based on the City of Los Angeles' thresholds, the proposed Project would have a shade/shadow impact if shadow-sensitive uses would be

shaded by Project-related structures for more than three hours between the hours of 9:00 a.m. and 3:00 p.m. (Winter Solstice and Spring Equinox), or for more than four hours between the hours of 9:00 a.m. and 5:00 p.m. (Summer Solstice and Fall Equinox).

Winter Solstice

Due to the low angle of the sun, shadows cast on December 21 would be the longest in length, and therefore, represent the worst-case scenario. Shadows generated by the proposed Project at 9:00 a.m. and 10:00 a.m. would be cast to the northwest onto residential uses. As the morning progresses, shadows cast to the northwest would reduce in length and would be reoriented toward the north. For example, by 12:00 p.m. the shadows cast by the proposed Project would no longer be cast on residential uses across Indiana Street. At this time, the proposed Project would not shade any other structure outside of the Project site. At 2:00 p.m. and 3:00 p.m., shadows cast by the proposed Project would extend north onto one single-family property and would continue to move and elongate to the east onto PCH. Project-generated shadows would extend across PCH to the sidewalk near the restaurant and retail uses across PCH. After 3:00 p.m., Project-generated shadows may continue to elongate as the sun sets but would not produce shadows on nearby residential uses. Further, Project shadows would function in this manner for a limited duration (i.e., during the winter season). As such, the proposed Project would not produce shadows for more than three hours between 9:00 a.m. and 3:00 p.m. affecting adjacent uses or property during the winter and impacts would be less than significant.

Spring Equinox

The analysis prepared for Project-generated shadows represent the median shade/shadow that would result from implementation of the proposed Project. At 9:00 a.m. and 10:00 a.m. would be cast to the northwest onto residential uses. As the morning progresses, shadows cast to the northwest would reduce in length and would be reoriented toward the north. For example, by 11:00 a.m. the shadows cast by the proposed Project would no longer be cast on residential uses across Indiana Street. At 2:00 p.m. shadows would be cast onto one of the single-family driveways to the north. At 3:00 p.m. and 4:00 p.m., the shadow would no longer be cast on the same single-family property and would cast a shadow onto the driveway of another single-family resident. The Project would produce shadows that extend onto PCH beginning at 3:00 p.m. and extend west at 4:00 p.m. and slightly farther west at 5:00 p.m., no longer casting shadows on residential uses to the north and west Due to the limited duration of these shadows, the Project would not produce shadows for more than three hours between 9:00 a.m. and 3:00 p.m. affecting adjacent uses or property during the spring and impacts would be less than significant.

Summer Solstice

Shadows cast by the proposed Project during the summer would be shorter than those in the winter and would generally only cast slightly onto the residential uses to the west at 9:00 a.m. and 10:00 a.m. In the afternoon, shadows would be cast onto the sidewalk immediately adjacent to the Project site at 2:00 p.m. and onto PCH toward the existing median at 4:00 p.m. However, the adjacent residential uses to the west would only be shaded at 9:00 a.m. and 10:00 a.m. Due to the limited duration of these shadows, the Project would not produce shadows for more than four hours between 9:00 a.m. and 5:00 p.m. affecting adjacent uses or property during the summer and impacts would be less than significant.

Fall Equinox

During the fall equinox, shadows would be projected to the west at the greatest extent at 9:00 a.m. and to the east at the greatest extent at 5:00 p.m. The Project would produce a shadow at the existing residential uses across Indiana at 9:00 a.m. and 10:00 a.m. The Project would not produce shadows onto residential uses during the rest of the day. The Project would produce shadows that extend onto PCH beginning at 2:00 p.m. However, the adjacent residential uses to the west would only be shaded at 9:00 a.m. and 10:00 a.m. Due to the limited duration of these shadows, the Project would not produce shadows for more than four hours between 9:00 a.m. and 5:00 p.m. affecting adjacent uses or property during the fall and impacts would be less than significant.

Lighting and Glare

Nighttime Lighting

The Project would result in additional lighting sources and potential sources of glare on the Project site and light trespass on adjacent residential neighborhoods. Regarding lighting, lighting sources on the Project site may include surface-mounted floodlights for landscaping, linear landscape luminaries, in-ground up-lights, and pathway lights for safety and wayfinding. Outdoor lighting would be used on the exterior of the building's street level, signage, pedestrian ways, plaza courtyards, the roof-deck swimming pool at PCC-South and PCC-North, and the parking structures. Interior lights would shine through the Project's glass windows at night, causing additional illumination.

The Specific Plan sets forth specific requirements for neon signage. Neon signage is not permitted on any building façades facing west in the PCC Mixed-Use 1 land use district. Neon Signage is not permitted on any building façade facing west in the PCC Commercial-3 land use district. Neon signage is not permitted on the Palm Avenue street frontage or on any building facades facing west in the PCC Mixed-Use 2 land use district between Mariposa and Palm Avenues or along the Palm Avenue. Electronic signage for the proposed Project must be in conformance with the signage regulations of ESMC Chapter 15-18 except as established and approved in a Master Sign Program for each land use district in the Specific Plan.

While the new structures on the Project site would result in greater general illumination on the Project site over the existing uses. The Project would be required to comply with existing California Building Code regulations pertaining to lighting, as adopted by reference pursuant to Chapter 13-1-1 of the ESMC. The development standards in the California Building Code provide requirements to limit light and glare to the extent feasible while providing sufficient light for safety and practicality.

Further, the Specific Plan would implement design guidelines to promote and enforce the City's lighting regulations. The Specific Plan requires the submittal of photometric studies as part of any site plan review submittal, which includes parking lots, and parking structures in the Specific Plan area. The Project represents an intensification of use over existing development on the Project site and would create a new source of substantial light on the Project site. Nonetheless, the Project and Project lighting elements would comply with ESMC and Specific Plan requirements, as well as the Site Plan Review. In addition, due to the presence of comparable multi-story office development along PCH, and the general urban character of the corridor and surrounding area, the proposed Project would not adversely affect existing nighttime views in the area due to new sources of nighttime lighting or glare. No mitigation is required.

Daytime Glare

Consistent with the California Vehicle Code, "no person shall place or maintain or display, upon or in view of any highway, any light of any color of such brilliance as to impair the vision of drivers upon the highway" and "limits to

the location of light sources that may cause glare and impair the vision of drivers." Additionally, the Specific Plan would require that "the type and location of parking structure, parking area and building lighting must prevent direct glare on to adjacent residential properties". Furthermore, the Project is subject to Site Plan Review to ensure materials that could create adverse light or glare effects are not included in the design. Per the Specific Plan, lighting must be adequate throughout the Specific Plan area and shielded to minimize off-site illumination, and the submittal of photometric studies is required as part of any Site Plan Review submittal, which includes parking lots and parking structures in the Specific Plan area. Therefore, the proposed Project would not create a new source of substantial daytime glare and less than significant impacts would occur. No mitigation is required.

Cumulative Aesthetics Impacts

Scenic Vistas/Scenic Quality

Due to the urban, developed character of the City and surrounding area, cumulative projects would not have a substantial adverse effect to existing scenic views of the Santa Monica Mountains, San Gabriel Mountains, the coastline, or beaches. The Project site, along with cumulative projects, are located in a highly developed urban environment. In general, visual resource impacts of the cumulative projects would be site-specific and would not be expected to combine with other projects in separate viewsheds to create a cumulative impact. However, other projects in close proximity to the Project site could cumulatively change the scenic character of the area in combination with the proposed Project. There are no identified cumulative projects within close proximity to the Project site or within the PCH view corridor. Cumulative projects would be required to comply with the development standards of the ESMC that include setbacks and height limits, and may similarly be subject to Site Plan Review.

Similar to the Project, future projects in the cumulative study area would be required to demonstrate compliance with applicable scenic quality regulations. If non-compliance with a particular regulation would result in a significant impact, mitigation would be required to reduce impacts to the extent feasible. Therefore, impacts would be less than significant and the Project would not result in a cumulatively considerable impact related to scenic vistas or conflicts with scenic quality regulations. No mitigation is required.

Shade/Shadow Effects

The extent to which a project could produce significant shade/shadow impacts is site-specific. Thus, the geographic area of potential shade/shadow impacts would be within the immediate vicinity of the Project site. There are no cumulative projects in the immediate vicinity of the Project, the closet cumulative project is the office proposed at 455 Continental Boulevard & 1995 E Grand Avenue, over 0.3-mile southwest of the Project site. Due to the distance and intervening development, this cumulative project would not combine with the proposed Project to produce shadows on nearby sensitive uses. Therefore, impacts would be less than significant and the Project would not result in a cumulatively considerable impact related to shade/shadow.

Light or Glare

The urbanized Project setting supports numerous nighttime lighting sources and contains buildings and facilities constructed of potentially reflective materials, including metal paneling and glass. The Project would have the potential to result in an incremental increase in light and glare associated with the new development. However, the California Vehicle Code requires new development to avoid glare impacts. In addition, all lighting installed on the Project site would comply with applicable guidelines included in the Specific Plan that would be comparable to ESMC regulations concerning lighting and glare. Lastly, the surrounding area is largely developed in nature and

located in an urban environment. Thus, the area currently includes sources of interior and exterior lighting. Therefore, impacts would be less than significant and the Project would not result in a cumulatively considerable impact related to light and glare. No mitigation is required.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on aesthetics as it relates to scenic vistas, scenic resource damage within a state scenic highway, regulations governing scenic quality, lighting and glare, and cumulative aesthetic impacts; therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.2 Agriculture and Forestry Resources

The Project site is located in an urban area on a site that is fully developed with buildings and asphalt paving and is included in the General Commercial (C-3) and Parking (P) zones. There are no existing agriculture or forestry activities on the site. No readily available opportunities for agricultural or forestry operations exist on site or in the surrounding area. According to the California Department of Conservation's California Important Farmland Finder, most of Los Angeles County, including the City of El Segundo, is not mapped as part of the state's Farmland Mapping and Monitoring Program; thus, the Project site does not contain Prime Farmland, Unique Farmland, or Farmland of State Importance (collectively "Important Farmland") (DOC 2020), nor does it contain any parcels under a Williamson Act contract (DOC 2018). Additionally, the Project site nor the surrounding area contain forestland or timberland. Therefore, impacts associated with agricultural and forestry resources would not occur.

Finding

Appendix B of the Notice of Preparation for the Project found no potential for significant impacts to agriculture and forestry resources; therefore, agriculture and forestry resources was not addressed in the Draft EIR. No mitigation would be required and no significant, unavoidable adverse impacts would occur.

2.4.3 Air Quality

Cumulatively Considerable Net Increase of Criteria Pollutants

Construction Emissions

Construction of the proposed Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (e.g., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (e.g., on-road haul trucks, vendor trucks, and worker vehicle trips).

Implementation of the proposed Project would generate air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, architectural coatings, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. The proposed Project would be required to comply with SCAQMD Rule 403 to control dust emissions generated during the grading activities. Internal combustion engines used by construction equipment, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$. The application of architectural coatings, such as exterior application/interior paint and other finishes, and

application of asphalt pavement would also produce VOC emissions; however, the contractor would be required to procure architectural coatings from a supplier in compliance with SCAQMD Rule 1113.

Criteria air pollutant emissions associated with temporary construction activity were quantified using CalEEMod. Daily construction emissions would not exceed the SCAQMD significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction in all construction years. Construction-generated emissions would be temporary and would not represent a long-term source of criteria air pollutant emissions. As such, impacts would be less than significant.

Operational Emissions

Operation of the proposed Project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicle trips; area sources, including the use of consumer products, natural gas hearths, and landscape maintenance equipment; and energy sources. Pollutant emissions associated with long-term operations were quantified using CalEEMod. The combined daily area, energy, mobile, vehicle testing, and off-road emissions would not exceed the SCAQMD operational thresholds for VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$. Impacts associated with Project-generated operational criteria air pollutant emissions would be less than significant.

Air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SCAQMD. Cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SCAQMD Rule 403 (Fugitive Dust), which sets forth general and specific requirements for all construction sites in the SCAQMD. The maximum daily PM_{10} and $PM_{2.5}$ emissions would not exceed the significance thresholds during proposed Project construction activities. Fugitive dust, as well as vehicle and equipment exhaust, generated during Project construction would contribute to the SCAB's nonattainment designation for PM_{10} and $PM_{2.5}$; however, this contribution would not be considered cumulatively considerable.

With regard to operational cumulative impacts associated with nonattainment pollutants, project-level thresholds of significance for criteria pollutants are relevant in the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality. Projects that exceed the SCAQMD project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. The proposed Project's operational emissions would not exceed the SCAQMD significance thresholds. Accordingly, the proposed Project would not result in a cumulatively considerable contribution to the nonattainment pollutants in the SCAB. The proposed Project would not result in a cumulatively considerable increase in emissions of nonattainment pollutants, and impacts would be less than significant during construction and operation.

Expose Sensitive Receptors to Substantial Pollutant Concentrations

Localized Significance Threshold

The closest off-site closest off-site sensitive receptors to the proposed Project are single-family and multi-family residences, immediately adjacent to the proposed Project to the west. Furthermore, the closest schools to the proposed Project are Center Street Elementary School, which is located approximately 1,600 feet to the west and El Segundo Middle School, which is located approximately 1,680 feet to the west.

An LST analysis was prepared to determine potential impacts to nearby sensitive receptors during construction of the Project. SCAQMD also recommends the evaluation of localized NO_2, CO, PM_{10}, and $PM_{2.5}$ impacts as a result of construction activities to sensitive receptors in the immediate vicinity of the Project site. Construction

activities associated with the proposed Project would result in temporary sources of on-site fugitive dust and construction equipment emissions. Off-site emissions from vendor trucks, haul trucks, and worker vehicle trips are not included in the LST analysis. Construction activities would not generate emissions in excess of site-specific LSTs; therefore, site-specific impacts during construction and operation of the proposed Project would be less than significant.

Carbon Monoxide Hotspots

The SCAQMD 1993 Handbook and the 2003 AQMP were used to determine CO attainment under the CAAQS and NAAQS to calculate CO hotspots. The Draft EIR determined potential operational impacts, from future development allowed by the proposed Project, would result in less than significant impacts associated with CO hotspots.

Health Impacts of Other Criteria Air Pollutants

Construction and operation of the proposed Project would result in emissions that would not exceed the SCAQMD thresholds for any criteria air pollutants, including VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. VOCs would be associated with motor vehicles, construction equipment, and architectural coatings; however, Project-generated VOC emissions would not result in the exceedances of the SCAQMD thresholds. Additionally, compliance with SCAQMD Rule 1113 would restrict the VOC content of coatings for construction applications. VOC and NO_x emissions associated with Project construction and operation could minimally contribute to regional O_3 concentrations and the associated health impacts. Because of the minimal contribution during construction and operation, health impacts would be considered less than significant.

Construction and operation of the proposed Project would also not exceed thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or obstruct SCAB from coming into attainment for these pollutants. The proposed Project would also not result in substantial DPM emissions during construction and operation, and therefore would not result in significant health effects related to DPM exposure. Additionally, the proposed Project would be required to comply with SCAQMD Rule 403, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, health impacts would be considered less than significant.

Construction and operation of the proposed Project would not contribute to exceedances of the NAAQS and CAAQS for NO_2. Project construction would be relatively short term, and off-road construction equipment would be operating at various portions of the site and would not be concentrated in one portion of the site at any one time. In addition, existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. Construction and operation of the proposed Project would not create substantial, localized NO_x impacts. Therefore, potential health impacts associated with NO_2 and NO_x would be less than significant.

CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots was discussed previously and is determined to be a less than significant impact. Thus, the proposed Project's CO emissions would not contribute to significant health effects associated with this pollutant.

In summary, construction and operation of the proposed Project would not result in exceedances of the SCAQMD significance thresholds for criteria pollutants and potential health impacts associated with criteria air pollutants would be less than significant.

Other Emissions

Construction Impacts

Odors would be potentially generated from vehicles and equipment exhaust emissions during construction of the proposed Project. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application. Such odors would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be less than significant.

Operational Impacts

Land uses and industrial operations that typically are associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding facilities (SCAQMD 1993). The proposed Project does not propose the aforementioned odor-generating land uses during the operational phase of the proposed Project. Furthermore, the proposed Project would comply with SCAQMD Rule 402, Nuisance, which prohibits the release of odors which may cause annoyance to a considerable number of persons, as well as other SCAQMD rules related to odor generation from restaurant activities. Therefore, the potential for the proposed Project to generate an odor impact is considered less than significant.

Because the SCAQMD air quality plans are regularly updated and consider the cumulative emissions of existing and projected development, it may be concluded that a project that does not have a direct air quality impact would not have a cumulative regional air quality impact. Therefore, the Project would have a less than significant cumulative air quality impact related to long-term regional emissions of all criteria pollutants because direct impacts would be less than significant. As such, the Project potential to result in a cumulatively considerable increase of any criteria pollutant for which the Los Angeles portion of the SCAB is in nonattainment under an applicable NAAQS or CAAQS would be less than significant, including O_3, PM_{10}, and $PM_{2.5}$.

The analysis for local CO hotspot impacts is based on the SCAQMD 2003 AQMP CO analysis. The qualitative assessment that demonstrated a less than significant impact is inherently a cumulative analysis, and the cumulative impact would be less than significant. Because the Project would not include non-permitted stationary sources of TACs onsite and permitted emergency generators would only be used for maintenance and testing, it would not contribute to long-term health risk impacts in the Project area.

The Project is not anticipated to generate nuisance operational odors; therefore, the Project would result in a less than cumulatively considerable operational odor impact.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on air quality as it relates to criteria pollutants, sensitive receptors, and other emissions; therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.4 Biological Resources

Under the existing conditions, the Project site is almost entirely developed with paved surfaces and buildings. A limited amount of landscaped areas is located within the Project site and along the public rights-of-way, consisting of small areas of ornamental trees, shrubs, and turf. This vegetation is ornamental in nature, entirely surrounded by urban development, and does not form a cohesive plant community that would provide quality suitable habitat for candidate, sensitive or special status wildlife species, or would support wildlife movement. According to the City's General Plan, the native vegetative cover throughout the City has been displaced by urban structures, and the primary vegetation now consists of domesticated species, including lawn grasses, ground covers, shrubs, and trees, planted for their ornamental qualities (City of El Segundo 1992). No wetlands or other jurisdiction waters are within the Project site (USFWS 2020). Further, any development activities conducted pursuant to the Specific Plan would be required to comply with all applicable requirements set forth by the City, including the City's street tree regulations (El Segundo 2021). All development activities are subject to the requirement to protect nesting birds, in compliance with the Migratory Bird Treaty Act, which prohibits the accidental or "incidental" taking or killing of migratory birds (U.S.C. 2021). Therefore, impacts associated with biological resources would not occur.

Finding

Appendix B of the Notice of Preparation for the Project found no potential for significant impacts to biological resources; therefore, biological resources were not addressed in the Draft EIR. No mitigation would be required and no significant, unavoidable adverse impacts would occur.

2.4.5 Cultural Resources

Historical Resources

The Fairfield Inn and Suites Hotel property (525 Sepulveda Boulevard; Assessor's Parcel Number [APN] 4139-025-091) was evaluated for historical significance and integrity in consideration of NRHP, CRHR, and City of El Segundo designation criteria and integrity requirements.

NRHP/CRHR Statement of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research indicated that at the time of construction, the Thunderbird Hotel (now Fairfield Inn and Suites Hotel) was one of the largest hotel projects in Southern California; however, this achievement was subsequently overshadowed by a suburban hotel building boom throughout the state that persisted alongside a housing and population boom in the 1950s and 1960s. The size of the Thunderbird Hotel and its status as a popular, local banquet hall and meeting center do not appear to have made a significant contribution to the history of the City of El Segundo or State of California's development. Moreover, with subsequent additions and alterations, the building no longer adequately represents the time period in which these events took place. Therefore, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners, employees, or long-term guests are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Therefore, the property does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The Fairfield Inn and Suites Hotel was constructed in 1959 and received two major additions in 1961 and 1979. The original 1959 hotel volume, 1959 conference room and restaurant wing, and 1961 addition at the time of these construction were excellent examples of the highly artistic Mid-Century Modern-style buildings designed by local Southern California-practicing architects Raymond Stockdale and Maxwell Starkham & Associates. The now-lost character-defining features would have been the curtain wall construction, colored spandrel paneling, cantilevered porches, rectangular and boxy proportions, and decorative concrete and metal screens on the main elevation. Although neither architect could be considered a master architect, the buildings were good examples of their work. However, due to major exterior alterations in 1987, none of the original decorative elements or character-defining features of the Mid-Century Modern buildings remain. The property as a whole has been altered beyond recognition, diminishing its once high artistic value. Finally, due to extensive exterior alterations, the property may no longer be considered representative of a significant and distinguishable entity whose components lack individual distinction. For these reasons, the Fairfield Inn and Suites Hotel property at 525 N. Sepulveda Boulevard does not appear eligible for listing in the NRHP under Criterion C or CRHR under Criterion 3.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials, or technologies.

City of El Segundo Statement of Significance

The City of El Segundo's cultural resource designation criteria is based on a combination of age and NRHP/CRHR designation criteria and integrity requirements. Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the subject property does not appear eligible under any local designation criteria, either individually or as part of a district.

Integrity Discussion

The Fairfield Inn and Suites Hotel property maintains integrity of location, as it remains in its original location. The Fairfield Inn and Suites Hotel property, including all three wings have had major exterior renovations since 1987. While the buildings maintain much of their original plan and structure, key-character defining features of the Mid-Century Modern style building were removed and replaced with ordinary modern materials. Therefore, the Fairfield Inn and Suites Hotel property does not maintain integrity of design. The property does not retain integrity of setting, as the setting in all directions has been altered into parking lots, high-rise office or hotels, or strip malls with anchoring grocery and retail stores, in the late 1980s and 1990s. The size, scale, and density of this modern setting would be unrecognizable to a person from the late 1950s or early 1960s. Similar to integrity of design, the Fairfield Inn and Suites Hotel property does not maintain integrity of materials and workmanship, due to the loss of the

highly artistic concrete and metal screens and introduction of modern materials on the main and side elevations. Key original elements such as the cladding, signage, porte-cochere, decorative elements, windows, and doors have all been removed and replaced. The Fairfield Inn and Suites Hotel property does not retain integrity of feeling, as the property no longer retains the ability to express itself as a hotel building constructed in the 1950s, built in the early years of LAX's "jet-age" modernistic expansion. Finally, the property no longer retains integrity of association either with original owners Allen E. and Marc Siegal, or with the original companies: Thunderbird Hotel Corporation or Hacienda Hotels. In summary, Fairfield Inn and Suites Hotel property does not retain the requisite integrity for designation, and does not rise to the level of significance required for designation at the national, state, or local levels.

Summary of Findings

No cultural resources were identified within the Project site as a result of the CHRIS records search, NAHC SLF search, extensive archival research, field survey, and property significance evaluation. The Fairfield Inn and Suites Hotel property located at 525 Sepulveda Boulevard (APN 4139-025-091) does not appear eligible for NRHP, CRHR, or City designation due to a lack of significant historical associations, architectural merit, and physical integrity. Therefore, this property is not considered an historical resource for the purposes of CEQA. Further, no potential indirect impacts to historical resources were identified. The Project would not cause a substantial adverse change in the significance of a historical resource, or otherwise result in a direct impact to a historical resource. No other adjacent resources were identified as a result of the records search or survey that could be indirectly impacted by the proposed Project. Therefore, the Project would have a less than significant impact on historical resources. No mitigation is required.

Disturbance of Human Remains

No prehistoric or historic burials were identified within the Project site as a result of the records searches. Additionally, the Project site is located within an urbanized area that has been subject to disturbance in the past as a result multiple construction projects and development. Moreover, the Project is not part of a dedicated cemetery and as such, the likelihood of disturbing human remains is low. In accordance with Section 7050.5 of the California Health and Safety Code, if human remains are found, the Los Angeles County Coroner shall be notified within 24 hours of the discovery. No further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains shall occur until the County Coroner has determined, within 2 working days of notification of the discovery, the appropriate treatment and disposition of the human remains. If the County Coroner determines that the remains are, or are believed to be, Native American, they shall notify the NAHC in Sacramento within 24 hours. In accordance with California PRC Section 5097.98, the NAHC must immediately notify those persons it believes to be the most likely descended from the deceased Native American. The most likely descendant shall complete their inspection within 48 hours of being granted access to the site. The designated Native American representative would then determine, in consultation with the property owner, the disposition of the human remains. Therefore, compliance with applicable state regulations related to the potential disturbance of human remains would be adequate to address any potential impacts, and no mitigation is required.

Cumulative Effect

The CHRIS record search identified twelve previously identified historic built environment resources within a 1-mile record search radius and no cultural resources immediately adjacent to the Project site. Only one of these, Hangar One at 5701 West Imperial Highway (P-19-174101), has been previously listed in the NRHP, and none of the Project addresses listed appear to be close enough in location to affect this historical resource. All other resources have

been determined ineligible and are not considered historic resources for the purposes of CEQA. The proposed Project was determined to have less than significant direct and indirect impacts on historic resources. Therefore, the proposed Project would not result in any cumulatively considerable impacts to historic resources.

The proposed Project was determined to have less-than-significant direct impacts on human remains. Existing regulations are adequate to address the potential for impacts due to the inadvertent discovery of human remains on the Project site. Other individual projects occurring in the vicinity of the Project site would also be subject to the same state requirements to contact appropriate agencies and coordinate with the County Coroner. Therefore, the proposed Project would not result in any cumulatively considerable impacts related to human remains.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on cultural resources as it relates to historical resources and disturbance of human remains, therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.6 Energy

Wasteful, Inefficient, or Unnecessary Consumption of Energy

Electricity

Construction

Temporary electric power for lighting, heating/cooling, and electronic equipment, such as computers inside temporary construction trailers, as well as lighting for construction activities, would be required during short-term construction activities. The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed and would cease upon completion of construction. When not in use, electric equipment would be powered off so as to avoid unnecessary energy consumption. All sources of electricity would be from existing power lines that serve the site and no new infrastructure would be required. There is nothing unusual about the proposed Project that would result in a wasteful, inefficient, and unnecessary use of electrical energy. The electricity used for construction activities would be temporary and would have a negligible contribution to the proposed Project's overall energy consumption. Impacts to electricity during construction would be less than significant, and no mitigation is required.

Operations

The operational phase would require electricity for multiple purposes including building heating and cooling, lighting, appliances, electronics, and water and wastewater conveyance. It was assumed that multi-family residential savings are 2% of electricity from the 2016 standards. For non-residential buildings, the savings are 10.7% of electricity.

Buildout of the proposed Project is estimated to have a total electrical demand of 3,143,911 kWh per year (or 3 million kWh per year) for proposed Project usage. The proposed Project's electrical consumption would be a small percentage (0.005%) of the County's annual use. SCE forecasts that its total energy consumption in 2024 (the Project buildout year) will be approximately 120,000 gigawatt hours of electricity (CEC 2018b). Based on the

Project's estimated electrical consumption of 3,143,911 kWh/year, the Project would account for approximately 0.0026% of SCE's total projected consumption during 2024 for the Project's buildout year.

In addition, the proposed Project would be built in accordance with the current Building Energy Efficiency Standards (Title 24) at the time of construction, which include robust requirements for energy efficiency. Also, the provisions of the CALGreen code apply to the planning, design, operation, construction, use and occupancy of every newly constructed building or structure. In mixed occupancy buildings, such as the proposed Project, each portion of a building must comply with the specific green building measures applicable to each specific occupancy. Therefore, due to the inherent increase in efficiency of building code regulations, the proposed Project would not result in a wasteful, inefficient, or unnecessary use of energy. Impacts related to operational electricity use would be less than significant.

Natural Gas

Construction

Natural gas is not anticipated to be required during construction of the proposed Project. Any minor amounts of natural gas that may be consumed as a result of proposed Project construction would be substantially less than that required for proposed Project's operation and would have a negligible contribution to the proposed Project's overall energy consumption.

Operations

Natural gas consumption during proposed Project operation would be required for various purposes, including building heating and cooling. Buildout of the proposed Project would consume approximately 3,898,778 kBTU per year. SoCalGas customers annual natural gas consumption is estimated to be 7,876 million therms per year. Therefore, the proposed Project's estimated natural gas consumption of 3,898,778 kBTU (or 38,988 therms) per year would be a small percentage (0.0005%) of SoCalGas' annual supply to customers. The proposed Project would be required to meet Title 24 requirements applicable at that time, as required by state regulations through the plan review process. Therefore, due to the inherent increase in efficiency of building code regulations, the proposed Project would not result in a wasteful, inefficient, or unnecessary use of natural gas. Impacts related to operational natural gas use would be less than significant.

Petroleum

Construction

Petroleum would be consumed throughout construction of the proposed Project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and VMT associated with the transportation of construction materials and construction worker commutes would also result in petroleum consumption. Heavy-duty construction equipment associated with construction activities, vendor trucks, and haul trucks would rely on diesel fuel. Construction workers would travel to and from the Project site throughout the duration of construction. It was assumed that construction workers would travel in gasoline-powered vehicles.

Fuel consumption from construction equipment was estimated by converting the total CO_2 emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon (The Climate Registry 2020).

The proposed Project is estimated to consume approximately 202,913 gallons of petroleum during the construction phase. The total expected petroleum use from the proposed Project's construction represents approximately 0.0003% of California's consumption of petroleum over the construction duration. In accordance CARB's Airborne Toxics Control Measure, the proposed Project would be required to restrict heavy-duty diesel vehicle idling time to 5 minutes, which would reduce petroleum usage. Overall, because petroleum use during construction would be temporary, and would not be wasteful or inefficient, impacts would be less than significant.

Operations

The fuel consumption resulting from the proposed Project's operational phase would be attributable to various vehicles associated with each land use. Petroleum fuel consumption associated with motor vehicles traveling within the City during operation is a function of VMT. Mobile sources from buildout of the proposed Project would result in approximately 199,110 gallons of petroleum fuel usage per year. The proposed Project would consume (at buildout), approximately 0.005% of the gasoline and 0.062% of the diesel sold within the County (in 2017). The SCAG region has household 15.3 VMT per capita and the City of El Segundo has a household 14.2 VMT per capita. The proposed Project is estimated to generate an average daily household VMT per resident of 10.9 miles, which is more than 15% less than the City's VMT. Therefore, the Project would not result in a significant transportation impact related to VMT. Over the lifetime of the proposed Project, the fuel efficiency of vehicles is expected to increase. As such, the amount of petroleum consumed as a result of vehicular trips to and from the Project site during operation would decrease over time. Operation of the proposed Project is expected to use decreasing amounts of petroleum over time due to advances in vehicle fuel economy standards.

Conflict or Obstruct Plan for Renewable Energy

The proposed Project would comply with all applicable regulatory requirements for the design of new buildings. Title 24 of the California Code of Regulations contains energy efficiency standards for residential and nonresidential buildings based on a state mandate to reduce California's energy demand.

Additionally, the proposed Project would receive electricity from SCE, which has the mandate to comply with SB 100. This policy requires that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California by 2045, and that the zero-carbon electricity resources do not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling. Thus, the proposed Project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency; therefore, impacts during construction and operation of the proposed Project would be less than significant.

Cumulative Energy Impact

Buildout of the Project, related projects, and additional forecasted growth in SCE's service area and SoCalGas' service area would cumulatively increase the demand for electricity and natural gas supplies and infrastructure capacity. Although Project development would result in the use of renewable and non-renewable resources during construction and operation, which could limit future availability of non-renewable energy sources, the use of such resources would be on a relatively small scale, would be reduced by measures making the Project more energy-efficient, and would be consistent with growth expectations for the service areas. Furthermore, as with the Project, during construction and operation, other future development projects would be expected to incorporate energy conservation features, comply with applicable regulations including CALGreen and state energy standards under Title 24, and incorporate mitigation measures, as necessary.

As with the proposed Project, other future development projects would be expected to reduce VMT by encouraging the use of alternative modes of transportation and other design features that promote VMT reductions. Furthermore, as described above, the Project would be consistent with the energy efficiency policies emphasized by the 2020 RTP/SCS. Since the Project is consistent with the Connect SoCal (2020 RTP/SCS), its contribution to cumulative impacts related to wasteful, inefficient, and unnecessary use of transportation fuel would not be cumulatively considerable and, thus, would be less than significant.

As such, the Project's contribution to cumulative impacts related to wasteful, inefficient and unnecessary use of electricity would not be cumulatively considerable and, thus, would be less than significant.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on energy as it relates to consumption of energy, conflict or obstruction of a plan for renewable energy, and cumulative impacts to energy, therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.7 Geology and Soils

Expose People or Structures to Fault Rupture

The Project site is not located within an Alquist-Priolo Earthquake Fault Zone (CGS 2020). According to the Geotechnical Evaluation, the closest such zone is located along the Newport-Inglewood Fault, located approximately 3.6 miles to the east/northeast of the Project site (Appendix E-1). In addition, as shown in Figure 4.5-1, no known faults traverse the Project site. Furthermore, the Project site would not directly or indirectly cause or exacerbate existing fault rupture risks from the construction of new buildings and associated infrastructure on the Project site. As a result, no impact related to surface rupture of a known earthquake fault would occur.

Expose People or Structures to Strong Seismic Ground Shaking

The Project site is located in the seismically active region of Southern California. The Newport-Inglewood Fault has been mapped in the vicinity of the Project site. This fault, as well as numerous other regional faults (e.g., Palos Verde Fault, Puente Hills Thrust Fault, Santa Monica Fault, Verdugo Fault, Raymond Fault, Whittier Fault, Sierra Madre, San Fernando, and San Andreas Fault), are capable of producing moderate to large earthquakes that could affect the City, including the Project site. The severity of ground shaking would depend on the magnitude of the earthquake, the distance to the Project site, and on-site geologic conditions. Ground shaking could lead to damage to structures and infrastructure, personal injury and death, utility service disruption, fire, explosion, and hazardous material spills.

The soils underlying the Project site fall within the characteristics of Class D (i.e., "Stiff Soil" profile), as defined in Chapter 20 of the American Society of Civil Engineers (ASCE) 7-10. This information was used to calculate the ground motions on the Project site, using the U.S. Geological Survey U.S. Seismic Design Maps tool (Appendix E-1). According to the Geotechnical Evaluation, the site has potential ground acceleration of 0.598. The Geotechnical Evaluation (Appendix E-1) provides the seismic parameters to be used in the structural design of the Project, based on the typical site materials encountered during subsurface exploration at nearby sites and are provides for preliminary design and estimating purposes. These parameters include the mapped spectral acceleration at short periods; the mapped spectral acceleration at a one-second period; the maximum considered earthquake spectral

response for short periods; the maximum considered earthquake spectral response at a one-second period; the design spectral response acceleration for short periods; and the design spectral response acceleration at a one-second period. The Geotechnical Evaluation recommends these parameters be verified by a site-specific geotechnical investigation, in accordance with the requirements set forth in Section J104.2.3, Engineered Grading Requirements, of the ESMC. Furthermore, the Project geotechnical consultant would provide final design parameters following observation and testing of site materials during grading. Depending on actual materials encountered during site grading and actual foundation loads, the design parameters presented in the Geotechnical Evaluation may require modification (Appendix E-1). Per Section J104.2.3, Engineered Grading Requirements, of the ESMC, recommendations in the geotechnical engineering report and the engineering geology report shall be incorporated into the grading plans or specifications.

Project construction would be completed in accordance with the CBC. As with all development within the City of El Segundo, development within the Project site would be required to comply with the seismic safety requirements of the CBC. The CBC provides procedures for earthquake resistant structural design that includes considerations for onsite soil conditions, occupancy, and the configuration of the structure, including the structural system and height. Although substantial damage to structures may be unavoidable during large earthquakes, the proposed structures would be designed to resist structural collapse and thereby provide reasonable protection from serious injury, catastrophic property damage, and loss of life.

As previously discussed, the 2019 edition of the CBC is based on the 2018 International Building Code, and all construction must be conducted in compliance with the CBC. Chapters 16 and 16A of the 2019 CBC include structural design requirements governing seismically resistant construction, including factors and coefficients used to establish seismic site class and seismic occupancy category for the soil/rock at the building location and the proposed building design. Therefore, upon Project compliance with the CBC and City policies aimed at minimizing geologic hazards, and the recommendations set forth in the site-specific geotechnical reports, the Project site would not directly or indirectly cause substantial adverse effects involving strong seismic ground shaking, and impacts would be less than significant.

Expose People or Structures to Liquefaction

As previously discussed, the depth to historic high groundwater in the Project vicinity is greater than 50 feet below the ground surface; therefore, the potential for liquefaction to occur beneath the Project site is considered to be very low. Furthermore, as shown in Figure 4.5-2, the site is not located within a mapped California Geologic Survey liquefaction hazard zone (Appendix E-1; CGS 2020). As such, seismic-related ground failure due to liquefaction would not be expected to occur on the Project site. The potential for collapsible soils is discussed under Threshold 4.5c below, and impacts would be less than significant.

Expose People or Structures to Landslides

As previously discussed, the Project site is not located within an earthquake-induced landslide zone. Because the Project site is not located within an area identified by the CGS as having potential for seismic slope instability, geologic hazards associated with landsliding are not anticipated at the site (Appendix E-1). Additionally, the Project would not exacerbate the potential for on- or off-site landslides. As such, implementation of the Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. Impacts would be less than significant.

Soil Erosion or Loss of Topsoil

Construction

Project construction would entail demolition and grading of portions of the Project site, followed by construction of the proposed structures. Construction activities would include site preparation, grading/earthwork, building construction, paving, and architectural coating. PCC-South includes excavations required for the subterranean parking structure. As discussed under Threshold 4.5c below, the Project site has the potential for collapsible soils and would require removal and recompaction of artificial fill soils and the upper 2 to 3 feet of the Dune Sand deposits. As recommended in the Geotechnical Evaluation, the undocumented fills underlying the Project site would be removed and replaced with compacted fill (Appendix E-1). These construction activities could result in temporary, short-term impacts related to a potential for erosion and loss of topsoil during the development of the Project site.

As previously discussed, Section J104.2.3 of the ESMC requires that all grading plans and permits must comply with the provisions of this section for NPDES compliance and that BMPs must be installed before grading begins to prevent erosion and related pollutants from discharging from the site. No grading permit would be issued unless the plans for such work include a SWPPP with details of BMPs, including desilting basins or other temporary drainage or control measures, or both, as may be necessary to control structures-related pollutants which originate from the site as a result of structures related activities. In addition to the SWPPP, a Wet-Weather Erosion-Control Plan may be required (depending on the season of construction), which includes specific BMPs to minimize the transport of sediment and protect public and private property from the effects of erosion. The required SWPPP would establish erosion and sediment control BMPs for construction activities. Typical examples of erosion-related construction BMPs include the following:

- Silt fences and/or fiber rolls installed along with the limits of work and/or the Project construction site
- Stockpile containment and exposed soil stabilization structures (e.g., Visqueen plastic sheeting, fiber rolls, gravel bags and/or hydroseed)
- Runoff control devices (e.g., fiber rolls, gravel bag barriers/chevrons, etc.) used during construction phases conducted during the rainy season
- Wind erosion (dust) controls
- Tracking controls at the site entrance, including regular street sweeping and tire washes for equipment
- Regular inspections and maintenance of BMPs

These BMPs would be refined and/or added to as necessary by a qualified SWPPP professional to meet the performance standards in the Construction General Permit. Compliance with the Construction General Permit would ensure that soil erosion would be minimized.

Although the Project would require excavation of soils related to construction of the subterranean parking structure and related to removal and recompaction of collapsible soils, this would not result in a substantial loss of topsoil. The Project site is currently developed and paved and does not contain available topsoil, with the exception of minimal landscaped areas adjacent to surface parking lots and buildings. The Project site is not used, and is not zoned for, agricultural uses or other activities that require the use of topsoil. Therefore, potential impacts associated with soil erosion and/or loss of topsoil would be less than significant.

Operations

Long-term operation of the Project would not result in substantial soil erosion or loss of topsoil as the majority of the Project site would be covered by the structures and paving, while the remaining portions of the site would be covered with irrigated landscaping. No exposed areas subject to erosion would be created or affected by the Project. In addition, the majority of the area surrounding the Project site is completely developed and would not be susceptible to indirect erosional processes (e.g., uncontrolled runoff) caused by the Project. With the implementation of applicable construction BMPs, impacts related to erosion or loss of topsoil would be less than significant.

Located on or Would Cause Unstable Soil

Landslides

As previously discussed, topographic relief across the site is from approximately 19 feet directed to the southwest toward Indiana Street and East Holly Avenue for PCC-South and PCC-Fairfield Parking, and approximately 11 feet directed toward the east toward PCH and south toward Mariposa Avenue for PCC-North (Appendix E-1). Additionally, the Project site is not within an area identified as having a potential for seismic slope instability. Because the Project site is not located within an area identified by the CGS as having potential for seismic slope instability, geologic hazards associated with landsliding are not anticipated at the site (Appendix E-1). No impacts would occur.

Liquefaction/Lateral Spreading

Potential impacts concerning liquefaction are evaluated under Threshold a(iii) above. Lateral spreading is the finite, lateral movement of gently sloping, saturated soil deposits caused by earthquake-induced liquefaction. Impacts associated with lateral spreading would be similar to those associated with liquefaction and would therefore be less than significant.

Subsidence

According to the Geotechnical Evaluation, once existing artificial fill and the upper 2 to 3 feet of the Dune Sands are removed, they are anticipated to be suitable for reuse as compacted fill (Appendix E-1). Volumetric changes in earth quantities would occur when excavated onsite soil materials are replaced as properly compacted fill. The Geotechnical Evaluation the existing artificial fills and upper collapsible Dune Sand deposits would shrink approximately 10% to 20%. The reprocessing of removed soils are anticipated to result in negligible subsidence; however, the ultimate earthwork quantities based on actual shrinkage and subsidence that occurs during the grading process would be determined in accordance with the requirements set forth in Section J104.2.3 of the ESMC.

In accordance with the CBC Section 1804A, the compacted fill shall comply with the provisions of an approved geotechnical report, which is required by the CBC and the ESMC. The proposed Project would be required to meet the most recent building safety criteria and construction design recommendations of the site-specific final geotechnical reports that would be prepared for the construction of Project buildings, including removal of existing artificial fills. As such, impacts related to subsidence would be less than significant.

Collapsible Soils

The Geotechnical Evaluation indicated that artificial fill soils in the upper 2 to 3 feet of the Dune Sand deposits exhibit collapsible potential upon wetting. If such materials are left in the current condition, excessive settlement of structures and site improvements could result due to the weight of new foundations and the introduction of water from rain or irrigation. Excessive settlement from such materials would be adequately addressed if they are removed and recompacted, as recommended by the Geotechnical Evaluation. Materials anticipated to exhibit this condition consist of the artificial fill soils and upper 2 to 3 feet of the Dune Sand deposits. Soils below the collapsible soil zone are anticipated to exhibit low compressibility characteristics in their current state (Appendix E-1).

The Geotechnical Evaluation concluded that that total settlement of foundations would be less than about 1 inch and bearing pressure is limited to about 4,500 to 5,000 pounds per square foot. Associated differential settlement should be less than 0.5 inches over 30 feet. Such settlement is anticipated to be tolerable for Project site development. The Geotechnical Evaluation recommends that the existing artificial fill be removed and recompacted at depths of about 3 to 6 feet (Appendix E-1).

Design-level geotechnical investigations are required in accordance with existing regulations. The proposed Project must be designed and constructed in accordance with Section J104.2.3, Engineered Grading Requirements, of the ESMC. All new building construction, alteration, or rehabilitation must comply with all applicable building and seismic codes of the City. In accordance with Section 1803A of the CBC, a geotechnical investigation is required that includes soil testing, laboratory testing or engineering calculations to evaluate soil types, soil expansion, depth of groundwater, deep foundations, rock strata, excavation, compacted fill, soil strength, seismic design criteria and other soil characteristics that need to be considered in the structural design and construction of buildings and infrastructure. Geotechnical investigations must be prepared by registered professionals (i.e., California Registered Civil Engineer or Certified Engineering Geologist). Recommendations from geotechnical investigations must be incorporated into the design and construction of the Project, as reviewed and approved by the City's Department of Planning and Building Safety. As such, impacts related to collapsible soils would be less than significant.

In summary, upon Project compliance with the CBC and City policies aimed at minimizing geologic hazards, and the recommendations set forth in the site-specific geotechnical reports, the Project site would not directly or indirectly exacerbate existing conditions related to on-site or off-site landslide, lateral spreading, subsidence, liquefaction or collapse, and impacts would be less than significant.

Located on Expansive Soil

As previously discussed, based on soil testing at the site, the near surface soils have a very low to low expansion potential. According to the Geotechnical Evaluation, testing for soil expansion would be required subsequent to rough grading and prior to construction of foundations and other concrete work to confirm these conditions (Appendix E-1). Expansive soils can undergo volume changes when they become wetted or dried, which could affect overlying structures. Given the expansion potential anticipated at the site, only nominal steps will be needed to mitigate adverse effects such as minor steel reinforcing of foundations and slabs, and moisture preparation and jointing details for flatwork. Typical mitigation measures described in Chapter 18 of the CBC to alleviate expansive soils include the following:

- Excavation of expansive soils until such a depth that competent material is encountered
- Installation of foundations designed to resist forces exerted on the foundation due by expansive soils
- Stabilization of the soils by chemical, dewatering, pre-saturation, or equivalent techniques

Such requirements would be set forth in the subsequent design-level geotechnical investigations prepared in accordance with Section J104.2.3, Engineered Grading Requirements, of the ESMC and the CBC. Potential impacts associated with expansive soils would be less than significant.

Soils Incapable of Supporting Septic Tanks

The Project site is currently served by sewer infrastructure, and any new development would require sewer connections. The Project site is located in an urbanized area that is currently connected to sewer lines. No septic tanks or alternative wastewater disposal is proposed; therefore, implementation of the Project would result in no impact.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on fault rupture, strong seismic ground shaking, liquefaction, landslides, erosion, unstable soil, expansive soil, and septic tanks; therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.8 Greenhouse Gas Emissions

Greenhouse Gas Emissions

Construction Emissions

Construction of the proposed Project would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. The total construction GHG emissions were calculated, amortized over 30 years, and added to the total operational emissions for comparison with the GHG significance threshold of 3,000 MT CO2e per year. Construction of the proposed Project is anticipated to last a total of 34 months. On-site sources of GHG emissions include off-road equipment and off-site sources including haul trucks, vendor trucks, and worker vehicles. The estimated total GHG emissions during construction of would be approximately 1,977 MT CO_2e over the construction period.

Operational Emissions

Long-term operations of the proposed Project would result in GHG emissions through mobile sources and area sources (landscape maintenance equipment); energy use (natural gas and generation of electricity consumed by the proposed Project); water supply, treatment, and distribution and wastewater treatment; and solid waste disposal. Annual GHG emissions from these sources were estimated using CalEEMod.

The net GHG emissions associated with development of the proposed Project would be below the SCAQMD GHG threshold of 3,000 MT CO_2e per year. Therefore, the proposed Project would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, and this would represent a cumulatively less than significant impact.

Conflict with an Applicable Plan, Policy, or Regulation

Consistency with the City of El Segundo CAP Measures

The City of El Segundo CAP identifies a variety of measures, which new projects must adhere with to with respect to renewable energy, conservation of energy and water, solid waste, global warming, urban design, transportation, and human health within the City. The proposed project would be consistent with these measures.

Consistency with the Connect SoCal (2020–2045 RTP/SCS)

SCAG's Connect SoCal is a regional growth-management strategy that targets per capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region. The Connect SoCal incorporates local land use projections and circulation networks in city and county general plans. Typically, a project would be consistent with the RTP/SCS if the project does not exceed the underlying growth assumptions within the RTP/SCS. The proposed Project would provide a minor amount of growth, estimated at 3.7% of the 2020 estimate and 3.6% in 2040 of the City's projected total population, the proposed 263 residential units could generate 618 persons upon its completion in 2024. If these 618 individuals would be new residents to the City, then the proposed Project would exceed SCAG's estimated projections through 2045 by 118 persons. The proposed Project would accommodate an expected 618 residents which exceed the overall population growth projections included in the Connect SoCal. As stated in the Connect SoCal 2020–2045 RTP/SCS, there is no obligation by a jurisdiction to change its land use policies, General Plan, or regulations to be consistent with the RTP/SCS, and lead agencies have the sole discretion in determining a local project's consistency with the RTP/SCS (SCAG 2020a). Because there is no wholly reliable population, housing, or employment data after 2010, as the U.S. Census is conducted every ten years, all data for years prior to the 2020 Census should be viewed as projections or estimates. The proposed Project would implement the guiding principles, goals and policies of SCAG's 2020–2045 RTP/SCS as they relate to livability, economic prosperity, and sustainability through the development of walkable, mixed use communities along major transportation corridors. The development of a mix of housing and job opportunities within 0.5 miles of transit, thereby alleviating pressure on suburban and open space areas to develop, is fully supportive of SCAG's strategies. Because the proposed Project would support SCAG's goals and strategies for growth in the region, and because the proposed Project would assist the development of new housing and improve the City's job/housing balance, impacts related to population growth assumed in Connect SoCal would be less than significant. The proposed Project would not conflict with any of the goals within SCAG's Connect SoCal. Therefore, the proposed Project would not conflict with the goal to improve GHG emissions in the region.

Consistency with the CALGreen

2019 CALGreen requirements are comprehensive and applicable to the proposed Project. The provisions of the CALGreen code apply to the planning, design, operation, construction, use and occupancy of every newly constructed building or structure. In mixed occupancy buildings, such as the proposed Project, each portion of a building must comply with the specific green building measures applicable to each specific occupancy (CEC 2019).

The proposed Project must comply with all relevant measures applicable to the types of structures to be built, including non-residential, low-rise residential, and high-rise residential. As such, the proposed Project would be consistent with the regulations set forth in CALGreen. The City approved Ordinance No. 1606, which adopted the 2019 edition of the CALGreen with amendments. Therefore, the proposed Project would be implemented consistent with the City's Municipal Code requirements and CALGreen.

Consistency with CARB's Scoping Plan

The Scoping Plan provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. The Scoping Plan recommends

strategies for implementation at the statewide level to meet the goals of AB 32 and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. The proposed Project would comply with all regulations adopted in furtherance of the Scoping Plan to the extent required by law and to the extent that they are applicable to the proposed Project.

Consistency with EO S-3-05 and SB 32

EO S-3-05 establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes for a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, EO B-30-15, and EO S-3-05.

Consistency with General Plan's Air Quality Element

The City of El Segundo General Plan (City of El Segundo 1992) includes various policies related to reducing GHGs (both directly and indirectly) because strategies that reduce criteria air pollutant emissions may also reduce GHG emissions. Total proposed Project emissions, including operation and amortized construction, would be approximately 2,921 MT CO_2e per year, which is less than the SCAQMD significant threshold of 3,000 MT CO_2e per year. Furthermore, based on the considerations previously outlined, the proposed Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and no mitigation is required. Therefore, this impact would be less than significant.

Cumulative Effect

GHG emissions inherently contribute to cumulative impacts. The proposed Project would not result in GHG emissions in exceedance of the SCAQMD significance threshold. Therefore, cumulatively, Project greenhouse gas (GHG) emissions would be less than significant.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on emissions generated, consistency with applicable regulations, and cumulative GHG effects; therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.9 Hazards and Hazardous Materials

Routine Transport, Use, or Disposal of Hazardous Materials/Release of Hazardous Materials and the Potential for Upset Conditions

Long-Term Operational Impacts

The operational phase of the proposed Project would not be expected to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Hazardous materials would be limited to use of commercially available cleaning products, chlorine for swimming pools, landscaping chemicals and fertilizers, and various other commercially available substances. Such chemicals are currently in use on the Project site, in association with the hotels. Although the Project would introduce additional amounts of commercially

available potentially hazardous materials, such as cleaning supplies and landscaping products, to the Project site, the routine transport, use, and/or disposal of these substances would be subject to applicable federal, state, and local health and safety laws and regulations, which would minimize health risk to the public associated with hazardous materials. Therefore, impacts would be less than significant and no mitigation is required.

Reasonably Foreseeable Upset and Accident Conditions

Long-Term Operational Impacts

According to the Los Angeles County Department of Public Works (LADPW 2020), the Project site is not located within 300 feet of an oil or gas well or 1,000 feet of a methane-producing site; therefore, methane impacts are not anticipated. Operation of the proposed Project would only require limited use of commercially available hazardous materials, including janitorial and landscaping products. Should the amount of onsite hazardous materials, including hazardous wastes, be greater than reporting thresholds (55 gallons of liquid, 500 pounds of solid, or 200 cubic feet of compressed gas), a Hazardous Materials Business Plan (HMBP) would be required under California HSC, Division 20, Chapter 6.11, Sections 25404–25404.9. The HMBP, which would be submitted to the El Segundo Fire Department (the local CUPA) via the California Environmental Reporting System, would include emergency and spill prevention and response measures, thereby reducing the potential for an upset or accident condition. Use of extremely hazardous materials and accumulation of acutely hazardous wastes are not anticipated. Operation of the proposed Project is not anticipated to impact nearby hazardous liquid pipelines or the adjacent gasoline service station. Project operational impacts are not anticipated to create a foreseeable upset or accident condition that would release hazardous materials to the environment, and impacts are less than significant.

Hazardous Materials within One-Quarter mile of an Existing or Proposed School

There are no public or private K–12 schools located within 0.25-mile of the Project site, therefore, impacts would be less than significant and no mitigation is required.

Cortese List

Long-Term Operational Impacts

Once operational, the PCC-North portion of the Project would be covered with buildings and minimal landscaping. Should potentially petroleum-contaminated soils be present at the gas station, they would be beneath the surface and covered. Therefore, operation of the proposed Project would not expose the public or environment to any potentially contaminated soils. Additionally, should contaminated soils be encountered during construction, the local regulatory agency, El Segundo Fire Department would be notified in accordance with state and local regulation. Under local agency oversight, contaminated soils would be excavated and/or remediated in accordance with state and local laws and regulations to minimize potential impacts to the public or environment, including potential vapor intrusion. With adherence to applicable laws and regulations, no impacts to operation of the proposed Project would occur.

Water is supplied to the Project by the City of El Segundo; therefore, direct use of groundwater is not required during operation of the proposed Project. The groundwater contaminated by volatile organic compounds identified to the southeast of the Project site is expected to flow south-southwest, away from the Project site. Therefore, the potential for vapor intrusion associated with this contamination is low. Impacts associated with potentially contaminated groundwater are not anticipated and no mitigation is required.

Near an Airport or within an Airport Land Use Plan

Short-Term Construction Impacts

The Project site is not located within the boundaries of the LAX Airport Influence area, and is therefore not subject to the ALUP requirements, including those for safety and noise. The Project site is located within 0.5-mile of LAX and is therefore regulated under 14 CFR 77.9 – Construction or Alteration Requiring Notice. In accordance with 14 CFR 77.9, the Project applicant or their contractor must file FAA Form 7460-1, Notice of Proposed Construction or Alteration at least 45 days before the start date of the proposed construction. The FAA will review the proposed construction and approve, deny, or require alterations to the construction in order to avoid impacts to navigational equipment and prevent safety hazards. With adherence to FAA regulations, the Project would not result in safety hazards for people residing or working in the Project area, and impacts would be less than significant.

Long-Term Operational Impacts

The Project would adhere to FAA regulations, and therefore safety hazards associated with airport navigation would be less than significant. Additionally, the Project site is not located within the LAX ALUP noise boundaries, therefore there are no anticipated impacts associated with excessive noise for people residing or working in the Project area. Therefore, impacts would be less than significant.

Impair or Interfere with an Adopted Emergency Response Plan or Emergency Evacuation Plan

Long-Term Operational Impacts

The eastbound lane of Mariposa Avenue at PCH would be reconfigured as a part of the proposed Project, from one left lane and one through-right lane to one left, one through, and one right-turn lane. The proposed right-turn lane would be approximately 69 feet in length from stop bar or crosswalk with a 60-foot taper with an overall length of approximately 90 feet, including the taper, which would accommodate peak hour 95th percentile queues. Therefore, the proposed Project improvement would improve the queue length on Mariposa Avenue, thereby improving Project access and circulation. Access to PCH and I-105 for emergency evacuation would not be impacted by Project implementation and no mitigation is required.

Wildland Fires

The proposed Project site is located in a highly urbanized area and is not located within an area of high wildfire hazard. Therefore, people and structures would not be subject to significant risks related to wildland fires, and impacts would be less than significant.

Cumulative Effect

For cumulative analysis, the hazardous materials geographic scope is generally restricted to the area immediately surrounding the Project site as the potential for risk is limited to the area immediately surrounding an affected hazardous material site or risk generator.

Cumulative projects would also be subject to federal, state, and local regulations related to hazardous materials and other public health and safety issues. In a manner similar to the proposed Project, adherence to these regulatory requirements would reduce incremental impacts associated with public exposure to health and safety hazards in each of the affected project areas. Additionally, most hazardous material and safety-related risks are

localized, generally affecting a specific site and immediate surrounding area, thus minimizing the potential for an impact to combine with another project to create a cumulative scenario.

Because cumulative projects would be fully regulated, thus reducing potential for public safety risks, cumulative impacts associated with exposure to hazards and hazardous materials would be less than significant. Through mitigation and compliance with regulatory requirements, the construction or operation of the proposed Project itself would not create significant human or environmental health or safety risks that could combine with other project impacts to create a significant and cumulatively considerable impact. For these reasons, the proposed Project would not result in cumulatively considerable impacts related to hazards and hazardous materials.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on hazards and hazardous materials as it relates to the proximity of an existing or proposed school; the proximity of the project to an airport or an airport land use plan; wildland fires; and cumulative impacts to hazards and hazardous materials; therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.10 Hydrology and Water Quality

Violate Water Quality Standards or Waste Discharge Requirements

Short-Term Construction Impacts

Grading and construction would potentially result in short-term erosion and associated siltation that could lead to adjacent storm drain infrastructure. Erosion-induced sedimentation affects water quality and interferes with photosynthesis; oxygen exchange; and the respiration, growth, and reproduction of aquatic species. Additionally, other pollutants, such as nutrients, trace metals, and hydrocarbons, can attach to sediment and be transported to downstream drainages leading to the Pacific Ocean which could contribute to the degradation of water quality. Other pollutants that could affect surface-water quality during the construction phase include petroleum products (gasoline, diesel, kerosene, oil, and grease), hydrocarbons from asphalt paving, construction equipment leaks, paints and solvents, detergents, fertilizers, and pesticides (including insecticides, fungicides, herbicides, and rodenticides).

In accordance with the State NPDES General Construction Permit and WDR Permit, as established by the Porter-Cologne Water Quality Act, the development of an acre or more of land must file a notice of intent with the SWRCB, followed by development of a site-specific SWPPP for construction activities. The property owner/developer must comply with the Construction General Permit applicable at the time a grading permit is issued. The SWPPP must include erosion- and sediment-control BMPs that will meet or exceed measures required by the determined risk level of the Construction General Permit, as well as BMPs that control the other potential construction-related pollutants. A Construction Site Monitoring Program that identifies monitoring and sampling requirements during construction is a required component of the SWPPP. The SWPPP is required to identify BMPs that protect stormwater runoff and ensure avoidance of substantial degradation of water quality.

Incorporation of required BMPs for temporary materials and waste storage and handling during construction, and equipment and vehicle maintenance and fueling would reduce the potential discharge of polluted runoff from

construction sites, consistent with the State NPDES General Construction Permit and the ESMC requirements for construction activities.

The Project site is not located in an area with high groundwater levels, and excavation activities associated with the PCC-South parking garage are not expected to encounter groundwater. However, perched groundwater conditions are dependent on seasonal precipitation, land use, among other factors, and may vary as a result through time. Additionally, the proposed drywells are anticipated to reach depths between 30 feet and 52 feet; therefore, it is possible that the construction of the drywells could encounter perched groundwater. In the event that groundwater is encountered during excavations, potentially polluted groundwater could be released to adjacent storm drains during dewatering activities, resulting in adverse impacts to downstream surface waters.

In the event that groundwater is encountered during excavations, the Project applicant/developer would be required by existing regulatory requirements to procure a dewatering permit from the Los Angeles RWQCB for pumping and disposal of groundwater. Groundwater dewatering would be controlled in compliance with the Waste Discharge Requirements for the Discharge of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties (Order No. R4-2018-0125, NPDES No. CAG994004). This permit requires permittees to conduct monitoring of dewatering discharges and adhere to effluent and receiving water limitations contained within the permit so that the water quality of surface waters is protected.

Compliance with existing regulations would prevent violation of water quality standards and minimize the potential for contributing sources of polluted runoff. Therefore, compliance with existing regulations would ensure that the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface quality from demolition and construction activities. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

The Project site falls within the Santa Monica Bay (SMB) Enhanced Watershed Management Program (EWMP), which includes numerous existing regional BMPs. Existing distributed BMPs were identified through the data request that included a total 2,212 BMPs in the SMB EWMP Group area. Of these distributed BMPs, 340 exist within the City of Los Angeles and 1,872 exist within the City of Santa Monica; however, there are no reported regional BMPs within the City of El Segundo. Therefore, LID BMPs would be implemented at the Project site to meet the local MS4 Permit requirements and remain consistent with the objectives of the SMB EWMP.

Project design, construction, and operation would be completed consistent with the SMB EWMP, and in accordance with the City Stormwater and Urban Runoff Pollution Control Ordinance, Municipal NPDES Permit, and the City's LID Manual, with the goal of reducing the amount of pollutants in stormwater and urban runoff. The LID Manual requires that post-construction stormwater runoff from new developments be infiltrated, evapotranspired, captured and reused, and/or treated through a high efficiency BMP onsite for the 85th percentile storm event, or 0.75 inches of precipitation, whichever is greater. The LID Manual states that BMPs are to be designed to manage and capture stormwater runoff. Infiltration systems are the first priority type of BMP improvements, as such systems provide percolation and infiltration of stormwater into the ground, which not only reduces the volume of stormwater runoff entering the MS4, but also contributes to groundwater recharge in some areas. The second priority BMP is capturing and reusing stormwater onsite for either landscape irrigation or toilet flushing. Proposed drainage for the proposed Project would include stormwater treatment features on all three development sites, in accordance with the City of El Segundo LID requirements.

Based on the Geotechnical Due-Diligence Evaluation, prepared by Albus-Keefe & Associates (see Appendix E-1 of the Draft EIR), the Utility Report determined that infiltration is feasible for stormwater treatment. One drywell at each proposed development site (PCC-South, PCC-Fairfield Parking, PCC-North) would be able to capture the required volume and treat that volume as quickly as it enters the drywell system. The infiltration rate for the site is 0.00186 feet per second, and a drywell with a diameter of 4 feet and an infiltration depth of 22 feet would provide a disposal rate of 0.514 cubic feet per second and would dispose of 88,819 cubic feet in 48 hours. Drywells are proposed below structure or on grade, with 20 feet of separation between the bottom of the sublevel or grade and infiltration zone.

The drywells would include overflow piping to convey stormwater to Indiana Street or Mariposa Avenue. Thus, stormwater in the proposed condition would flow only to the City of El Segundo storm drains The proposed peak flow rate that would be used to design the overflow piping is the reduced peak flow rate generated after infiltration. Because the peak flow rate would be reduced in the proposed condition, it is assumed that the City of El Segundo storm drains will have more than enough capacity to handle the flow rate generated by the proposed Project.

Once the water quality volume is met through the drywells, the "higher flows" would enter overflow pipes, which would discharge stormwater to the local storm drain systems. Therefore, capture and re-use BMPs to be constructed as part of the Project would result in the treatment of the entire required volume for the Project site and the elimination of pollutant runoff up to the 25-year storm event. In the post-Project condition, all stormwater overflow would be conveyed into the City's storm drain system and would not be conveyed to Caltrans facilities.

The implementation of LID features would, to the maximum extent practicable, reduce the discharge of pollutants into receiving waters, including inadvertent release of pollutants (e.g., hydraulic fluids and petroleum); improper management of hazardous materials; and trash and debris during Project operations. In accordance with the all applicable state and local regulations, Project source controls to improve water quality would be provided for outdoor trash storage/waste areas and outdoor loading/unloading areas. As a result of compliance with existing regulations, the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality during the long-term Project operations. Impacts would be less than significant and no mitigation is required.

Deplete Groundwater Supplies or Interfere with Groundwater Recharge

Implementation of the proposed Project would decrease the amount of impervious area within each of the three development areas. PCC-South would decrease from 88.6% to 86.3% impervious; PCC-Fairfield Parking would decrease from 100% to 96.3% impervious, and PCC-North would decrease from 100% to 88.4% impervious. The proposed Project would incorporate drywells to facilitate infiltration in compliance with applicable LID requirements. The Project site is not currently used for groundwater infiltration, either by spreading or by groundwater injection. Upon construction and operation of the drywells, groundwater recharge at the site would increase in comparison to existing conditions, resulting in beneficial impacts. The West Coast Basin Barrier Project, which consists of groundwater injection wells that prevent seawater from intruding into the underlying aquifers of the West Coast Groundwater Basin, is near the Project site. However, development of the Specific Plan would not interfere with the operation of this barrier system.

The proposed Project is not anticipated to encounter groundwater during excavation for the subterranean parking garage on PCC-South. However, perched groundwater conditions may vary over time, and in the unlikely event that groundwater is encountered during excavations, the Project applicant/developer would be required by existing regulatory requirements to procure a dewatering permit from the Los Angeles RWQCB for pumping and disposal of groundwater. Groundwater dewatering would be controlled in compliance with the Waste Discharge Requirements for the Discharge

of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties (Order No. R4-2018-0125, NPDES No. CAG994004). Temporary dewatering, if required, would be short-term and would not substantially interfere with groundwater supplies.

Additionally, the Project site is within the Coastal Plain of Los Angeles-West Coast (Groundwater Basin 4-011.03), which has been designated as Very Low Priority with respect to establishment of a GSA and completion of a Groundwater Sustainability Plan (SGMA 2020). Therefore, the proposed Project would not substantially decrease groundwater supplies and no mitigation is required.

Alter Existing Drainage Pattern (Erosion, Surface Runoff, Exceed Capacity Drainage System, Impede or Redirect Flood Flows)

The proposed Project site is fully developed in the existing condition and is located in a highly urbanized portion of El Segundo, surrounded by developed properties. Implementation of the proposed Project would not alter the existing drainage patterns on the site such that downstream streams or rivers would be affected. The Project would infiltrate stormwater in accordance with all applicable LID regulations and would continue to outflow into the existing storm drain system. No naturalized drainages or creeks would be affected. Additionally, post-Project runoff is anticipated to be less than in the existing condition and the amount of impervious surfaces would also be reduced. Therefore, the Project would not substantially alter the existing drainage pattern of the site, including through the alteration of the course of a stream or river or through the addition of impervious surfaces. Impacts would be less than significant and no mitigation is required.

Flood Hazard, Tsunami, or Seiche Zones

As stated in the City's General Plan Public Safety Element, along the City's coastal areas, tsunamis and seiches associated with seismic events could cause devastating damage. The coastal portion of the City and adjacent portions of the City of Los Angeles are identified by the State as tsunami hazard areas, and as a result, there is the potential for damage to Southern California Edison and Chevron facilities, and the Hyperion Treatment Plant located along the coast. Residential portions of the City are located above the potential hazard area and are not at high risk. The Project site is not located within a tsunami inundation map for emergency planning, as delineated by the California Emergency Management Agency, California Geologic Survey (CGS 2009).

The Project site is located in FEMA Zone X, which is an area of minimal flood hazard, and an area determined to be outside the 0.2% annual chance floodplain (i.e., 500-year floodplain) (FEMA 2020). Therefore, the Project would not be located in an area with any significant risks of flooding and would not have the potential to impede or redirect floodwater flows. In addition, the Project site is not located adjacent to or immediately downstream of any large body of water susceptible to seiches (i.e., oscillations in a body of water due to earthquake shaking).

The main document addressing emergency preparedness in the City is the Emergency Operations Plan. The Emergency Operations Plan provides a basis for operations and for managing critical resources during emergencies, delineation of lines of authority and responsibility, and procedures for requesting interagency and private assistance. The General Plan determined that the level of risk associated with a tsunami and seiche are "low" (City of El Segundo 1992). Therefore, existing state, regional and local regulations related to emergency preparedness would be sufficient to address potential hazards associated with floods, tsunamis, or seiches, which have not been identified as hazards for the Project site. Impacts would be less than significant and no mitigation is required.

Conflict with Water Quality Control Plan or Sustainable Groundwater Management Plan

The proposed Project would comply with applicable water quality regulatory requirements, including implementation of a SWPPP, stormwater BMPs, and LID design, which would minimize potential off-site surface water quality impacts and contribute to a reduction in water quality impacts within the Dockweiler Subwatershed and the overall South Santa Monica Bay Watershed. In addition, with compliance with these regulatory requirements, the Project would reduce potential water quality impairment of surface waters such that existing and potential beneficial uses of key surface water drainages throughout the jurisdiction of the Los Angeles RWQCB Basin Plan would not be adversely impacted. As a result, the Project would not conflict with or obstruct the Los Angeles RWQCB Basin Plan.

With respect to groundwater management, SGMA empowers local agencies to form GSAs to manage basins sustainably, and requires those GSAs to adopt Groundwater Sustainability Plans for crucial groundwater basins in California. A GSA has not been established for the West Coast Basin, as it is not considered a high priority basin. Further, the Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. As a result, the Project would not conflict with or obstruct this sustainable groundwater management plan. Impacts would be less than significant and no mitigation is required.

Cumulative Effect

Water Quality

The geographic context for the analysis of cumulative impacts associated with water quality is the South Santa Monica Bay Watershed, which is already largely urbanized with impervious surfaces. The cumulative effect of past projects—both point sources of pollution and non-point sources caused by urbanization—have resulted in substantial water quality problems in the region's major waterways. Cumulative development could add new sources of stormwater runoff. Construction activities associated with development could temporarily increase the amount of exposed surfaces that could contribute to sediments in stormwater runoff. Additionally, materials associated with construction activities could be deposited on surfaces and carried to receiving waters in stormwater runoff.

Although the land surrounding the Project site is largely developed with impervious surfaces, continued redevelopment within the Project area could slightly increase the amount of impervious surfaces that could increase stormwater runoff rates and amounts, as well as changes in land use that may increase the amount of pollutants in stormwater runoff. The release of such pollutants, however, would be minimized through compliance with terms and conditions of the NPDES permit, CALGreen Code, California Building Code, ESMC, and the ordinance codes of other authorities in the region—which all require implementation of a SWPPP for development and redevelopment projects. In summary, all cumulative development would be subject to existing regulatory requirements to protect water quality and minimize increases in stormwater runoff. All development within the South Santa Monica Bay Watershed would be subject to the water quality standards outlined in the Basin Plan and would comply with any established TMDLs. The continuing review process would ensure that cumulative development within the watershed would not substantially degrade water quality.

In addition, the Project would comply with existing and future regulations to protect water quality, including the Construction General Permit. Compliance with existing regulations would prevent violation of water quality standards and minimize the potential for contributing additional sources of polluted runoff. Therefore, Project

impacts associated with water quality standards and polluted runoff would be less than significant, and the Project would not contribute considerably to cumulative impacts.

Drainage

The South Santa Monica Bay Watershed is already largely urbanized with impervious surfaces. Cumulative development within the City could potentially increase the amount of impervious surfaces that could cause or contribute to storm drain system capacity exceedance, alter the existing storm drain system, and/or require construction of new or expanded facilities. However, new development within the watershed would be subject to the same requirements for LID infrastructure and BMPs to address the potential for increased runoff from development sites. All projects must comply with current state and local environmental regulations, such as the ESMC mandates. Potential impacts to drainage associated with the Project would be less than significant, and the Project would not contribute considerably to cumulative impacts.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on hydrology and water quality. Therefore, no mitigation is required, and no significant, unavoidable adverse impacts would occur.

2.4.11 Land Use

Physically Divide an Established Community

The physical division of an established community typically refers to the construction of a linear feature (e.g., a major highway or railroad tracks) or removal of a means of access (e.g., a local road or bridge) that would impair mobility within an existing community or between a community and outlying area.

The proposed Project involves the implementation of the proposed Specific Plan, which would redevelop the existing surface parking lots of the Fairfield Inn and Suites Hotel and Aloft Hotel properties, as well as the old Hacienda Restaurant, through the adoption of a Specific Plan that allows for the development of 263 new housing units and approximately 11,252 square feet of commercial/retail uses. Under the existing condition, the Project site is developed land and is not used as a connection or thoroughfare between established communities. Instead, connectivity within the area surrounding the Project site is facilitated via local roadways. The proposed Project would not result in the construction of new driveways; rather, the Project would allow for access via existing driveways on PCH and Indiana Street. Further, the eastbound lane of Mariposa Avenue at PCH would be reconfigured as a part of the proposed Project, from one left lane and one through-right lane to one left, one through, and one right-turn lane. Therefore, the Project does not include the construction of a new roadway, which would impair mobility within the existing Project site or the surrounding area. Rather, the Project would increase access at existing driveways and provide improved level of service at Mariposa Avenue and PCH through improvements at Mariposa Avenue. As such, the Project would not impede movement within the Project site, within an established community, or from one established community to another. In addition, the Project has specific objectives which focus on access and mobility: Enhance vehicular circulation through intersection improvements and street widening. Therefore, impacts associated with the division of an established community would be less than significant. No mitigation is required.

Conflict with an Applicable Land Use Plan, Policy, or Regulation

Consistency with the Connect SoCal (SCAG 2020–2045 RTP/SCS)

The proposed Project would not conflict with the applicable goals in the RTP/SCS adopted for the purpose of avoiding or mitigating an environmental effect. The Project would redevelop the Project site's existing conditions and would produce approximately 56 new employees within the Specific Plan area within the City of El Segundo. In addition, the Project site's vicinity is served by existing public transit such as various bus routes (Metro Line 232, Metro Line 625, Beach Cities Line 109, Los Angeles Department of Transportation [LADOT] Commuter Express 438, and LADOT Commuter Express 574) as well as the Metro C Line. The Metro C Line is a light rail line, which runs between Redondo Beach and Norwalk. The nearest station is the Mariposa Station, which is just over 0.5-mile from the Project site. The Project site would bring residential development to nearby major employers, including LAX, energy/gas/oil and aerospace companies and near the City's "super block" development, which contains a mixture of office and research and development uses, thereby reducing travel demands by developing a mix of residential housing opportunities in proximity to employment centers. For these reasons, the Project would not conflict with the applicable goals in the RTP/SCS adopted for the purpose of avoiding or mitigating an environmental effect.

City of El Segundo General Plan Consistency

A review of the General Plan shows that the Specific Plan is compatible and consistent with the goals and policies outlined in the General Plan. The Specific Plan was prepared to provide the essential relationship between the policies of the General Plan and actual development of the Project site. By functioning as a regulatory document, the Pacific Coast Commons Specific Plan provides a means of implementing the City's General Plan. All future development plans and entitlements within the Specific Plan boundaries must be consistent with the standards set forth in the Specific Plan The Specific Plan would be consistent with applicable goals and policies of the General Plan. While hotel uses are allowed in the existing General Commercial (C-3) Zone, and the Fairfield Inn and Suites and the Aloft Hotels both have existing Conditional Use Permits, the two existing hotels do not comply with some of the development standards of the General Commercial (C-3) Zone because they were built prior to the current development standards. Thus, they are legal non-conforming as to building height, floor area ratio, and certain setback requirements. Through the implementation of the Specific Plan, these two hotels would be brought into full conformity with the land use designation and zoning for the Project site. COM-1 and COM-2 allows hotels and several other commercial uses that are either accessory to hotel uses or complementary uses. The existing hotel properties are consistent with this definition, and thus, would no longer be considered non-conforming uses within the Specific Plan area. Additionally, it should be noted there will be no additional floor area added to the hotel properties.

The Project requests the approval of a General Plan Amendment (No. GTA 19-01) to change the Land Use Designation from "General Commercial" and "Parking" to "Pacific Coast Commons Specific Plan (PCCSP)" with an accompanying Land Use map change. Upon approval of the proposed amendment, the Project would be brought into compliance with the General Plan Land Use Designation.

City of El Segundo Municipal Code

<u>Amendments to the Zoning Code</u>

The Project requests a Zone Text Amendment No. ZTA 19-08 to add a new ESMC Section15-3-2(A)(12) "Pacific Coast Commons Specific Plan (PCCSP)". Approval of the proposed Project, in accordance with the provisions outlined in Title 15 of the ESMC, would ensure compliance with applicable zoning standards. Additionally, through the application

process, the City would thoroughly review all plans for the proposed Project to ensure compliance with the ESMC, and other relevant plans, policies, and regulations.

Specific Plan

When a specific plan is adopted in accordance with the procedure outlined above, the specific plan may effectively supersede portions or all of the current zoning regulations for specified parcels or plan area, and becomes an independent set of zoning regulations that provide specific direction to the type and intensity of uses permitted, and may define other types of design and permitting criteria. The proposed Specific Plan is adopted by ordinance and serves as the primary zoning document for the Plan Area. Where the Specific Plan is silent, the relevant sections and requirements of the zoning regulations shall apply. The development standards would be regulated by the Specific Plan and administered and enforced by the City in accordance with the ESMC. The Specific Plan supersedes any conflicts with ESMC zoning regulations. Therefore, upon approval of the proposed Project, the Project would be consistent with the El Segundo Zoning Code for the purposes of avoiding or mitigating environmental effect.

Cumulative Land Use and Planning Impacts

Cumulative land use impacts could occur if any of the related projects would result in incompatible land uses, or result in land uses that are inconsistent with adopted land use plans when combined with the impacts of the Project. Given the built-out conditions of the greater Los Angeles Metropolitan region, including the Project site, cumulative development would likely convert existing underutilized properties in the Project site's area to revitalized higher-density developments to respond to the need for housing, sources of employment, and associated retail land uses. The Project would benefit the surrounding community by replacing underutilized properties; add residential uses to a job-rich community; and improve local and regional access to the regional transportation network. Furthermore, by providing additional housing and employment in close proximity to transit, the Project would assist the City in achieving short- and long-term planning goals and objectives related to reducing urban sprawl, efficiently using existing infrastructure, reducing regional congestion, and improving air quality through the reduction of vehicle miles traveled. This is consistent with SCAG and other regional policies for promoting more intense land uses adjacent to transit stations and job centers.

Land use conflicts are also typically site-specific and not cumulative in nature; in other words, despite the number of cumulative projects in a given area, they would not necessarily compound to create cumulative land use conflicts. Cumulative incompatibility issues associated with surrounding developments or projects are anticipated to be addressed and mitigated for on a project-by-project basis. Further, all related projects in the City would be subject to the same local development standards, such as those identified in the ESMC, as the proposed Project. Therefore, cumulative impacts related to land use and planning would be less than significant. No mitigation is required.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on land use and planning; therefore, no mitigation is required, and no significant, unavoidable adverse impacts would occur.

2.4.12 Mineral Resources

There are no oil wells or oil/mineral extraction activities on the Project site (CalGEM 2020). Current on-site land uses do not allow for oil/mineral extraction. According to the Department of Conservation's Mineral Lands Classification map, the City is within the Mineral Resources Zone-3, which is characterized as areas containing

mineral deposits of significance of which cannot be evaluated from available data (DOC 1979). Ordinarily, classification of a mineral deposit as MRZ-2a or MRZ-2b by the State Geologist will constitute adequate evidence that an area contains significant mineral deposit; thus, the Project would not result in the loss of mineral resources of known importance to the state (DOC 2002). Although the El Segundo Oil Field underlies the City, production has declined since 1967 and only five wells continue to produce oil resources (City of El Segundo 1992). Therefore, the Project is not expected to result in the loss of availability of a locally-important mineral resource recovery site delineated on the local general plan or other land use plan. Thus, impacts associated with mineral resources would not occur and will not require further evaluation in the Draft EIR.

Finding

Appendix B of the Notice of Preparation for the Project found no potential for significant impacts to mineral resources; therefore, mineral resources were not addressed in the Draft EIR. No mitigation would be required and no significant, unavoidable adverse impacts would occur.

2.4.13 Noise

Generation of a Substantial Temporary or Permanent Increase in Ambient Noise Levels

Traffic Noise Exposure to Future Project Occupants

Aside from exposure to aviation traffic noise, current CEQA noise-related guidelines do not require an assessment of exterior-to-interior noise intrusion, environmental noise exposure to occupants of newly created Project residences, or environmental noise exposure to exterior non-residential uses attributed to the development of the proposed Project. Nevertheless, the California Building Code requires that interior background noise levels not exceed a CNEL of 45 dB within habitable rooms. Traffic noise exposure analysis at the exteriors of occupied residences and outdoor living areas is provided for informational purposes. Additionally, this analysis of outdoor environmental noise to the newly created Project residences would be consistent with the "post-construction acoustical analysis" per Program N1-1.9A from the City's General Plan Noise Element.

An open window or an open sliding door to an adjoining patio or balcony greatly compromises the overall sound insulation performance of the studied wall assemblies. However, when such windows and doors are closed, all studied sample facades are anticipated to exhibit a predicted STC rating of at least 35, and thus would provide sufficient exterior-to-interior sound insulation from outdoor traffic noise to yield interior background sound levels that are less than 45 dBA CNEL and thus compliant with the City and state standards. Recall that none of the predicted exterior traffic noise levels at the studied receptor locations exceeded 72 dBA CNEL; thus, the STC rating value (for closed windows and doors) subtracted from these exterior noise values must result in interior noise levels of less than 45 dBA CNEL (e.g., 72 – 36 = 36 dBA CNEL, which is less than 45). The apparent requirement for

closed windows and doors means that the design of these habitable rooms should feature mechanical ventilation or an air-conditioning system to provide interior comfort for the occupants.

Stationary Operations Noise

The incorporation of new multi-family homes and a mix of commercial uses attributed to development of the proposed Project would add a variety of noise-producing mechanical equipment.

Residential Unit Heating, Ventilation, and Air Conditioning Noise: Each of the new occupied residential units would be expected to feature a split-system type air-conditioning unit. For the PCC-South buildout, 34 ACC units were modeled on rooftops. Each ACC unit has an SPL of 71 dBA at 3.28 feet based on available data from the manufacturer (Goodman 2020). The predicted sound emission level from the combination of all operating condenser units at off-site single-family receptors would be as high as 57 dBA L_{eq} to the west of the PCC-South and 61 dBA L_{eq} to the west of PCC-North. The effect of building structure occlusion (i.e., rooftop mass and parapet blocks the direct sound path between noise-producing equipment and the off-site residential receptors) on the predicted HVAC sound exposure levels at nearest existing off-site residences is expected to be at least 10 dB of noise reduction. The operation of these Project residential air-conditioning units would result in a less-than-significant noise impact to the surrounding residential community.

At the outdoor area (i.e., pool and outdoor amenities) of the existing Aloft hotel that is north of the PCC-South area and its collection of operating rooftop ACC units, application of the aforementioned 10 dB structural occlusion to predicted operation noise results yield a Project-attributed aggregate ACC noise level no greater than 47 dBA, which is below the estimated existing nighttime sound level of 61.5 dBA L_{eq} for this offsite commercial property location. The operation of these Project residential air-conditioning units would result in a less-than-significant noise impact to the surrounding commercial properties.

Excessive Groundborne Vibration or Groundborne Noise Levels

Under the right conditions, construction activities may expose persons to excessive groundborne vibration or groundborne noise, causing a potentially significant impact.

Groundborne vibration attenuates rapidly, even over short distances. The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions found in FTA and Caltrans guidance. The impact of vibration-induced annoyance to occupants of nearby existing homes would be less than significant. No mitigation is required.

Construction vibration, at sufficiently high levels, can also present a building damage risk. However, the predicted 0.035 ips PPV at the nearest residential receiver 46 feet away from on-site operation of the bulldozer during grading would not surpass the guidance limit of 0.3 ips PPV for preventing damage to residential structures (Caltrans 2013b). Because the predicted vibration level at 46 feet is less than both the annoyance and building damage risk thresholds, vibration from conventional construction activities would be less than significant. No mitigation is required.

Once operational, the Project would not be expected to feature major onsite producers of groundborne vibration. Anticipated onsite mechanical systems like pumps, compressors, and fans are designed and manufactured to feature rotating or reciprocating components (e.g., impellers, rotors, and pistons) that are well-balanced with

isolated vibration within or external to the equipment casings. On this basis, potential vibration impacts due to Project operation would be less than significant. No mitigation is required.

Expose People Residing or Working in Airport Land Use Plan to Excessive Noise Levels

There are no private airstrips within the vicinity of the Project site. The closest airport to the Project site is the Los Angeles International Airport approximately 0.66-mile north of the site. According to the Final LAX Part 150 Noise Exposure Map Update Report (ESA 2016), the Project site is outside of the 65 dBA CNEL aviation operation noise contour predicted in the report for 2020, and therefore would not expose workers or new occupants of the proposed Project residences or exterior uses to aviation overflight noise levels greater than 65 dBA CNEL. Hence, on this basis the potential impact with respect to aviation traffic noise would be less than significant.

Cumulative Noise Impacts

Temporary/Periodic Increases in Ambient Noise Levels

The Project would result in temporary noise increases during construction activities. The construction period of future developments under the Project has the potential to overlap with the construction of other development projects in the City; however, none of the anticipated cumulative projects are in close enough proximity to the Project site. Noise due to construction of other projects would not meaningfully combine with future development under the Project to produce a cumulative noise effect during construction.

In sum, cumulative construction noise is likely to be dominated by the closest or loudest activity to the receptor, and the combination will be no more than a barely perceptible difference (i.e., up to a 3 dB change).

Additionally, all future development under implementation of the Project, as well as unrelated construction projects within City limits, would be required to comply with limits on allowable construction hours per relevant portions of the City's noise ordinance. Cumulative impacts due to cumulative construction noise would be less than significant.

Vibration

Other foreseeable projects within the vicinity of the Project site would not be close enough to create a combined excessive generation of groundborne vibration; therefore, cumulative impacts associated with excessive groundborne vibration would be less than significant.

Permanent Increase in Ambient Noise Levels

Off-Site Traffic

Future development from implementation of the Project along with other unrelated projects would generate off-site traffic noise. When calculating future traffic impacts, the traffic study included traffic attributed to both the Project and unrelated projects. Thus, future traffic noise prediction results with and without the Project already account for the cumulative impacts from unrelated projects contributing to traffic increases. Since the noise impacts are generated directly from the traffic analysis results, the Existing and Year 2025 traffic with and without Project predicted increases in traffic noise levels described herein already reflect cumulative impacts. The noise level increases associated with both of these scenarios would generate a noise level increase of less than 3 dBA along the studied sample roadways in the vicinity of the Project. As such, anticipated increases would be below the

significance threshold of 3 dBA; hence, the incremental effect of the Project on off-site traffic noise is not cumulatively considerable. Cumulative off-site traffic noise impacts would be less than significant.

Stationary Sources

Noise from operation of stationary electro-mechanical equipment added to the outdoor ambient sound environment as a result of Project implementation would include permanent on-site noise sources (e.g., rooftop HVAC equipment). A cumulative impact could occur if noise produced from such sources due to implementation of the Project were to combine with noise produced from the operation of other unrelated projects in the vicinity to create a cumulatively significant permanent increase in ambient noise levels. However, noise emission from HVAC equipment attenuates with distance and can be occluded by structures and terrain. Additionally, the operation of future projects under the Project, along with the operation of other unrelated projects, would be subject to applicable requirements from the City's noise ordinance, which limits the exterior noise levels at residences. Hence, for these two reasons, cumulative impacts to outdoor ambient noise levels resulting from Project stationary sources would be less than significant.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on noise as it relates to groundborne vibration, exposing people residing or working within an airport land use plan to excessive noise levels, and cumulative noise impacts; therefore, no mitigation is required and no significant, unavoidable adverse impacts would occur.

2.4.14 Population and Housing

Induce Substantial Population Growth

Short-Term Construction Impacts

Construction activities at the Project site would lead to the temporary need for construction workers, which may come from the City, other areas of Los Angeles County, or elsewhere within the SCAG region. The proposed Project involves fairly common construction requirements that would not require a highly specialized labor force to permanently relocate from other regions. Construction of the Project is anticipated to last approximately 34 months. The different construction activities require specific skill sets for a much shorter duration than the overall construction schedule. Because construction workers would not be needed continuously and only for varying portions of the Project phases, it is reasonable to assume that workers/crews would work at the Project site on a temporary basis only, and thus, are not likely to relocate their households as a consequence of the construction job opportunities presented by the Project. Because the demand for construction workers would be short-term, and because the Project site within an urban metropolitan region with a high diversity of skilled labor, a permanent need for new workers to relocate in order to accommodate the proposed Project's temporary construction workforce is not anticipated. Any changes in the City or regional population, housing, or employment due to short-term construction activities would be less than significant.

Long-Term Operational Impacts

The proposed Project would redevelop the existing surface parking lots of the Fairfield Inn and Suites Hotel and Aloft Hotel properties through the adoption of the Specific Plan to allow for the development of 263 residential units

and 11,252 square feet of commercial space. The Specific Plan's three development areas are Pacific Coast Commons – South (PCC-South); Pacific Coast Commons – Fairfield Parking (PCC-Fairfield Parking); and Pacific Coast Commons – North (PCC-North). PCC-North would be developed with 143 residential units and 2,223 gross square feet of commercial space. PCC-Fairfield Parking would be developed with approximately 3,273 gross square feet of ground-floor commercial and a parking structure for the Fairfield Inn and Suites Hotel. PCC-South would be redeveloped with 120 residential units and 5,756 gross square feet of commercial space. Up to 3,700 square feet of the commercial space across all three sites could be fast casual restaurant space and the remainder would be other commercial uses allowed in the Pacific Coast Commons Specific Plan area. The Project would replace the existing General Commercial (C-3) and Automobile Parking (P) zones with the proposed Specific Plan, thereby enabling future development within the Specific Plan area. As such, the proposed Project would directly result in the building new housing where housing currently does not exist. The redevelopment of existing parking lots could result in new and unplanned population growth within the City.

Population Projections

SCAG estimates that Los Angeles County would have 10,407,000 residents by 2020 and 11,647,000 residents by 2045. SCAG and the Department of Finance estimate that the City would have 16,777 residents by 2020 and 17,200 residents by 2045. SCAG's forecasted population growth for the City of El Segundo is 500 persons between 2016 and 2045.

Using population and housing estimates from the California Department of Finance, the City has an occupancy rate of 2.35 persons per household (DOF 2020). It is likely that the proposed residential units would accommodate a combination of existing residents and new residents that either currently work within the City and/or new residents that would be hired as a result of projected employment generation within the City. Additionally, the City's 2020 housing vacancy rate of 4.7% is less than Los Angeles County's housing vacancy rate 6.1% (DOF 2020). As such, the proposed Project is anticipated to be growth-accommodating rather than growth-inducing.

Because the proposed Project would support SCAG's goals and strategies for growth in the region and because the proposed Project would assist the development of new housing and improves the City's job/housing balance, impacts related to population growth would be less than significant. Although the proposed Project would provide a resident population that exceeds SCAG's projections, this growth is not considered substantial and it would further attainment of local and regional goals, as described above.

Employment Projections

The proposed Project would introduce 11,252 gross square feet of commercial uses to the Project site. Based on the assumption that up to 3,700 square feet of the commercial development would be fast-casual restaurant use, the proposed Project is estimated to generate approximately 56 new employees within the Specific Plan area. With the occupancy of the proposed Project, the number of jobs in the City would increase by approximately 56 positions, which could be filled by unemployed persons in the City or by unemployed persons in Los Angeles County. The proposed Project's anticipated employment would represent a nominal percent (0.009%) of SCAG's projected 639,000 new jobs in Los Angeles County between 2016 and 2045. SCAG estimates that the City would have 52,400 jobs by 2045. The proposed Project's anticipated employment would represent a nominal percent (1.36%) of SCAG's projected 4,100 new jobs in the City between 2016 and 2045. The estimated 56 new full-time employees resulting from the proposed Project would make up a small percentage of the overall expected growth in the City and would not exceed the SCAG employment projections.

Housing Projections Analysis

SCAG projects that Los Angeles County will have an increase of 800,000 housing units between 2016 and 2045, and that the City will have an increase of 300 units during this same period. The proposed Project's 263 residential units would represent 0.03% of SCAG's projected housing for Los Angeles County and 87.7% of the projected housing for the City. Therefore, the proposed Project's housing units would not exceed the projections for housing within the City, as set forth in the 2020–2045 RTP/SCS.

California's housing element law requires that each city and county develop local housing programs designed to meet its fair share of existing and future housing needs for all income groups. This effort is coordinated when preparing the state-mandated Housing Element of the City's General Plan. The 5th Cycle RHNA allocation for 2013 to 2021 sets forth the City's fair share allocation for the planning period is 69 units for the City's Housing Element. The proposed Project would create new housing and would include affordable housing in accordance with the negotiated Development Agreement. The specific allocation between the types of low income housing has yet to be determined; however, the proposed low-income units would satisfy a portion of the City's mandated 29 low income units, and a portion of the City's requirement for 40 moderate/above income units, as set forth in the Housing Element.

Because the proposed Project will be occupied within the timeframe of the 6th Cycle (2021 to 2029), it is most relevant to the analysis. The City's fair share allocation for the planning period is 492 units. The proposed Project would create new housing and would include affordable housing in accordance with the negotiated Development Agreement. The specific allocation between the types of low-income housing has yet to be determined; however, the proposed low-income units would satisfy a portion of the City's mandated 6th Cycle RHNA allocation. As such, the proposed Project's 263 new residential units would assist the City in meeting the mandated RHNA allocation and would be consistent with and supportive of the City's Housing Element projections for new residential units within the City.

Jobs/Housing Balance

As previously described, the City is considered to be a very jobs-rich community. The proposed Project would generate additional housing available for the community, as the jobs-housing balance of the proposed Project would be 0.3:1, which is a very housing-rich project. Therefore, the proposed Project would facilitate a more balanced jobs-housing profile for the City, which currently maintains an approximately 6.9:1 jobs/housing balance.

Displace Substantial Numbers of Existing Housing or People

The Project site consists of surface parking areas of the Fairfield Inn and Suites Hotel and Aloft Hotel properties, as well as the underutilized commercial space associated with the hotel. No housing uses are located on the Project site, and Project implementation would not require demolition of existing housing or displace people or housing. The proposed Project would include the construction of a mixed-use development that would add approximately 263 housing units to the City. Impacts would be less than significant.

Cumulative Effect

Assuming 2.35 persons per household, the proposed Project's residential units would accommodate 618 individuals. If these 618 individuals would be new residents to the City, then the proposed Project would exceed SCAG's estimated projections through 2045 by 118 persons. Other than the proposed Project, only the proposed

540 E. Imperial Avenue and 1225 Mariposa Avenue proposals, are anticipated to include residential development in the City. Therefore, the remaining cumulative projects would be primarily increasing employment in the City and potentially further exacerbating the jobs-rich profile of the City, which could increase the vehicle miles traveled between employment centers and residential land uses. While the proposed Project would provide employment opportunities to the local and regional area, the employment growth caused by the Project falls well within current projections for employment growth in the City and Los Angeles County. The proposed housing growth generated by the Project would further the goals and strategies of SCAG and the City's General Plan by providing housing in an urban setting in close proximity to transit, while contributing to a more balanced jobs-housing community. Although, the proposed Project's residential population would exceed SCAG's population projections, it can be assumed that many of the residential units would accommodate workers within the City and could reduce vehicle miles traveled by providing housing in proximity to employment centers. Therefore, the unplanned population growth is not considered to be substantial and impacts would be less than significant. Therefore, in combination with other future foreseeable projects, it is not anticipated that the proposed Project would create a cumulatively considerable impact to population, housing or employment.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on population and housing related to inducing growth during construction and displacing a substantial number of people or housing; therefore, no mitigation is required, and no significant, unavoidable adverse impacts would occur.

2.4.15 Public Services and Recreation

Fire Protection

Construction

Construction activities associated with the proposed Project may temporarily (i.e., 48 months during proposed construction) increase demand for fire protection and emergency medical services. Construction activities may involve the operation of construction equipment and machinery, storage, handling, and disposal of combustible materials, and the use of flammable or toxic materials. To comply with California Department of Industrial Relations, Division of Occupational Safety and Health and Fire and Building Code requirements, construction managers and personnel would be trained in fire prevention and emergency response, and fire suppression equipment specific to construction would be maintained on site. Project construction would comply with all applicable codes and ordinances related to the maintenance of mechanical equipment, handling and storage of flammable materials, and cleanup of spills of flammable materials. Thus, compliance with regulatory requirements would reduce the potential for construction activities to expose people to the risk of fire explosion related to hazardous materials.

Due to compliance with applicable codes and fire safety standards, Project construction would not adversely impact firefighting and emergency services to maintain acceptable service ratios, response times or other performance objectives for fire protection. Therefore, impacts would be less than significant, and no mitigation is required.

Operation

The need for new or expanded public services (such as fire protection facilities) is typically associated with a population increase. Project employment and new residential uses would result in approximately 56 new employees and 618 residents on the Project site. In the context of the City's population projections, the proposed Project would

exceed the forecasted population growth. The proposed Project would accommodate an expected 618 residents which from the implementation of the Specific Plan exceed the overall population growth projections included in the Connect SoCal. ESFD has reviewed the proposed Project and has determined existing protection facilities were sufficient for the proposed Project (Carver 2020). Therefore, it is expected that the population and employment growth associated with the Project would not outpace the existing or future service capacity of the ESFD.

The Project site is currently served by two existing fire stations. No expansion of these facilities is currently contemplated. Payment of development fees by the Project applicant/developer would be used to offset the costs of increased personnel or equipment that could be required to maintain acceptable service ratios, response times, or other performance objectives.

Furthermore, the proposed Project would be designed and constructed in accordance with all applicable provisions of the fire code, which includes requirements for adequate fire flows, width of emergency access routes, turning radii, automatic sprinkler systems, fire alarms, and floor to sky height limits along emergency access routes.

The proposed Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities. Impacts would therefore be less than significant. No mitigation is required.

Police Protection

Construction

There is the potential for Project construction activities to create an increase in demand for police protection services, as construction sites can be sources of attractive nuisances, can provide hazards, and can invite theft and vandalism when not properly secured. This could result in an increase in the demand for police protection services. Consequently, developers and construction contractors typically take precautions to prevent trespassing through construction sites. During construction, the Project applicant/developer or its construction contractor would implement temporary security features including security fencing, lighting, and locked entry. These features would reduce the need for police protection services during the Project's construction phase. Potential short-term construction impacts to police services would not result in substantial adverse physical impacts associated with the provision of new or physically altered police protection facilities, and impacts would be less than significant.

Operation

The increased use of the Project site attributable to the proposed Project would be expected to increase the frequency of emergency and non-emergency calls to the ESPD. While the Project site currently places some demand on the ESPD due to the occupied hotel uses, the proposed Project would increase demands relative to existing conditions. The ESPD has stated that the existing police station facilities are sufficient to provide service to the proposed Project and that the development of the proposed Project would not result in the need for new facilities and/or physically altered facilities to maintain acceptable service ratios, response times, or other performance objectives (McDaniel 2020).

The Project site is currently served by the ESPD at 348 Main Street. No expansion of this facility is currently contemplated (McDaniel 2020). Payment of development fees by the Project applicant/developer would be used to offset the costs of increased personnel or equipment that could be required to maintain acceptable service ratios, response times, and other performance objectives. The proposed Project would incorporate operational practices and design elements to increase safety and to reduce the potential for crime to occur, which could lessen the demand for police protection

services at the Project site. The proposed Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered police protection facilities and potential impacts would be less than significant.

Schools

The proposed Project's approximately 56 new employees and 618 residents would generate students that would attend ESUSD schools. Using the student generation rates from ESUSD, at 263 dwelling units, the Project could generate approximately 35 elementary school students, 20 middle school students, and 28 high school students (Farris 2020).

All the schools with the exception of Center Street Elementary School continue to have capacity with the addition of proposed Project enrollment. However, communication with EUSD indicates the existing schools are sufficient to support the proposed Project (Farris 2020). Education Code Section 17620 allows school districts to assess fees on new residential and commercial construction within their respective boundaries. Pursuant to California Government Code Section 65995, the payment of these fees by a developer serves to fully mitigate all potential project impacts on school facilities from implementation of a project to less-than-significant levels. Sections 65996(a) and (b) state that such fees collected by school districts provide full and complete school facilities mitigation under CEQA. These fees can be collected without special city or county approval, to fund the construction of school facilities necessitated by the impact of residential and commercial development activity.

Therefore, with the payment of the applicable school fees, the operation of the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered schools, or the need for new or physically altered schools, the construction of which could cause significant environmental impacts to maintain acceptable service ratios, or other performance objectives for schools. Such impacts on schools are considered less than significant. No mitigation is required.

Parks

The Project would include 56 new employees and 618 residents. At least a portion of these residents are anticipated to patronize the various public parks and recreation facilities located in proximity to the Project site. Since the City's Parks are within the State of California Parks Department standard of park space at about 3.5 acres of park space per 1,000 residents (Petit 2020), the additional 618 residents would not exceed existing standards of service for parks.

Additionally, the Project would be subject to the City's Development Impact Fee, which requires new development projects to pay impact fees, which would support park improvements as well as fund capital costs for other new and existing infrastructures. Pursuant to the Development Impact Fee Program, the Project applicant/developer would pay its fair share of impact fees based on the fee category and adopted Development Impact Fee rates. The Project would contribute funds to the El Segundo Recreation and Parks Department through Development Impact Fees. Further, the Project would include common open space areas, including rooftop pools and community rooms. These on-site amenities would provide an alternative to off-site public parks and recreational facilities, allowing the Project's residents to recreate on the Project site while incrementally reducing impacts to off-site public parks and recreational facilities. Therefore, impacts associated with the need for new or expanded park facilities would be less than significant. No mitigation is required.

Other Public Facilities

Other public facilities and services provided within the City include library services and City administrative services. Library services are provided at ESPL located at 111 West Mariposa Street, approximately 1.8 miles west of the Project site. The proposed Project would generate approximately 56 new employees and 618 residents. Pursuant to the Development Impact Fee Program, the Project applicant/developer would pay its fair share of impact fees based on the fee category and adopted Development Impact Fee rates. The ESPL indicated that no new facilities would be required as part of the proposed Project; although the digital library needs to be enhanced. Therefore, impacts to other public facilities in the area resulting from the proposed Project would be less than significant. No mitigation is required.

Increase in the Use of an Existing Neighborhood, Regional Park, or Recreational Facility

The Project would include 56 new employees and 618 residents. The City's Recreation and Parks Department is responsible for developed park land that provides a wide variety of attractions and amenities including more than 15 parks, athletic fields, recreational water amenities, a skate park, dog park and community garden. In addition, the City also offers recreational programs and activities for residents, including adult sports, swimming classes, a teen center with a variety of activities and programs, and the Senior Club of El Segundo hosts a wide variety of activities and socials at the Joslyn Center. At least a portion of these residents are anticipated to patronize the various public parks and recreation facilities located in proximity to the Project site. The Project would include common open space areas, which would consist of a central community space with a variety of recreational amenities, as well as landscaped areas around the Project site. These on-site amenities would provide an alternative to off-site public parks and recreational facilities, allowing the Project's residents to recreate on the Project site while incrementally reducing impacts to off-site public parks and recreational facilities. The El Segundo Recreation and Parks Department indicated no new facilities would be required as part of the proposed (Petit 2020). Additionally, the Project would be subject to the City's Development Impact Fee, which requires new development projects to pay impact fees, which would support park improvements as well as fund capital costs for other new and existing infrastructures. Pursuant to the Development Impact Fee Program, the Project applicant/developer would pay its fair share of impact fees based on the fee category and adopted Development Impact Fee rates.

As such, with payment of the required development impact fees related to parks and recreation in combination with provision of on-site recreational facilities, the Project would meet the anticipated demand for neighborhood and regional parks or other recreational facilities. Project residents and the public would have access to adequate on-site recreational facilities, which would offset increased use of existing parks and recreational facilities in the City. Therefore, implementation of the Project would not result in a substantial increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur. Impacts to neighborhood and regional parks would be less than significant. No mitigation is required.

Inclusion of or Requirement for Construction/Expansion of Recreational Facilities

The Project would include common open space areas, which would consist of a central community space with a variety of recreational amenities, as well as landscaped areas around the Project site. The construction of these common open space areas and associated recreational amenities is analyzed throughout the Draft EIR. Additionally, the Project would be subject to the City's Development Impact Fee, which requires new development projects to pay impact fees, which would support park improvements as well as fund capital costs for other new and existing

infrastructures. Pursuant to the Development Impact Fee Program, the property owner/developer would pay its fair share of impact fees based on the fee category and adopted Development Impact Fee rates. As such, Project implementation would not require the construction or expansion of recreational facilities, and impacts would be less than significant.

Cumulative Effect

As defined in the State CEQA Guidelines Section 15130, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, present, and probable future projects within the cumulative impact area for population, housing, and employment. The cumulative study area used to assess potential cumulative population and housing impacts includes the City of El Segundo, ESFD and ESPD service areas, and ESUSD. Cumulative impacts on public services including fire and police protection, parks, and schools would result when projects collectively increase demand on services such that additional facilities or services must be constructed or provided. Cumulative projects would likely result in an incremental increase in the demand for fire protection, police protection, parks, schools (for cumulative projects that have a residential component), and other public services. Because the City is nearly built out, the proposed Project and all cumulative projects are located in areas currently served by ESFD, EPSD, and ESUSD. Therefore, in combination with other past, present, and future foreseeable projects, it is not anticipated that the proposed Project would create a cumulatively considerable impact on public facilities or recreational facilities.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on police and fire protection services, parks, schools, and other public facilities as well as impacts related to recreation; therefore, no mitigation is required, and no significant, unavoidable adverse impacts would occur.

2.4.16 Transportation

Conflict with Circulation System Plan, Ordinance, or Policy

RTP/SCS Consistency Analysis

The Project would redevelop the Project site's existing conditions and would produce approximately 56 jobs in operation within the City of El Segundo. In addition, the Project site's vicinity is served by existing public transit such as various bus routes (Metro Line 232, Metro Line 625, Beach Cities Line 109, LADOT Commuter Express 438, and LADOT Commuter Express 574) as well as the Metro C Line. The Metro C Line is a light rail line, which runs between Redondo Beach and Norwalk. The nearest station is the Mariposa Station, which is just over 0.5-mile from the Project site. The proposed Project would not conflict with the applicable goals in the RTP/SCS.

City of El Segundo General Plan Consistency

The Project requests the approval of a General Plan Amendment (No. GPA 19-01) to change the Land Use Designation from "General Commercial" and "Parking" to "Pacific Coast Commons Specific Plan (PCCSP)" with an accompanying Land Use map change. Upon approval of the proposed amendment, the Project would be brought into compliance with the General Plan Land Use Designation.

General Plan Buildout Comparison

Because the adoption of the proposed Specific Plan would change the overall framework development for the Project site established in the General Plan, a comparison of trip generation estimates of the proposed Project with the currently designated General Plan land uses was conducted. The City's General Plan identifies the portion of the site that is south of Mariposa Avenue as General Commercial, with a maximum floor area ratio of 1.0 for PCC-Fairfield Parking and PCC-South, and the portion to the north of Mariposa Avenue as Parking. The General Plan land uses are projected to generate an estimated 4,026 daily trips, including 203 trips (112 inbound/91 outbound) during the AM peak hour and 262 trips (145 inbound/117 outbound) during the PM peak hour. The Project is projected to generate an estimated net increase of 2,517 daily trips, including 132 trips (47 inbound/85 outbound) during the AM peak hour and 178 trips (103 inbound/75 outbound) during the PM peak hour. The General Plan land uses are projected to generate 1,509 more daily trips than the proposed Project, including 71 more trips during the AM peak hour and 84 more trips during the PM peak hour. The proposed Project would generate fewer trips compared to the General Plan land uses.

Level of Service Analysis for General Plan Consistency

Although the City's LOS policy would not be applicable as a transportation impact under CEQA per SB 743, the study area intersection operations analysis results are summarized below for the following scenarios:

Existing Plus Project Traffic Conditions

CEQA Guidelines Section 15064.3(b) focuses on newly adopted criteria (VMT) pursuant to SB 743 for determining the significance of transportation impacts. Pursuant to SB 743, the focus of transportation analysis changed from vehicle delay to VMT. As stated in CEQA Guidelines Section 15064.3(c), the provisions of Section 15064.3 shall apply prospectively, and a lead agency may elect to be governed by the provision of Section 15064.3 immediately. However, the information below related to LOS is provided for information purposes and for assessment of consistency with General Plan policies.

The Existing plus Project scenario of the impact analysis at Mariposa Avenue and PCH has also been analyzed without the Project improvement to show its potential benefit when compared to the Existing Base and Existing plus Project with improvement conditions. The analysis shows that LOS at Mariposa Avenue and PCH is better with the addition of the Project-related improvement than without. A queuing analysis was conducted for the eastbound approach with and without Project improvement to show the potential improvement in queue length.

Future Plus Project Traffic Conditions

The Future plus Project scenario of the impact analysis at Mariposa Avenue and PCH has also been analyzed without the Project improvement to show its potential benefit when compared to the Future Base and Future plus Project with improvement conditions at Mariposa Avenue. The analysis shows that LOS at Mariposa Avenue and PCH is better with the addition of the Project-related improvement than without. A queuing analysis was conducted for the eastbound approach with and without Project improvement to show the potential improvement in queue length.

City of El Segundo Climate Action Plan

The City's CAP includes measures related to the circulation, including parking, multi-modal streets, pedestrian/bicycle networks, and transit accessibility. The Project would provide a combination of electric vehicle charging and alternative fuel vehicles and carpooling parking in compliance with El Segundo Municipal Code and CALGreen requirements. The proposed Project would include shared parking, which would provide a more efficient use of land. As such, a shared parking analysis for the Project has been prepared to assess the potential parking demand and determine if adequate parking supply would be available on the site.

Bicycle parking and storage would be provided in compliance with CALGreen and the City's Municipal Code. The proposed Project would provide new living and working opportunities in close proximity to transit, thereby increasing ridership. Public transit that operates in the vicinity of the Project site includes the Metro C Line and multiple bus lines. Additionally, the proposed Project would reduce single-occupancy vehicle use by providing a mix of land uses in walkable proximity to the Metro C Line and the City's downtown. The Project would not conflict with the applicable measures related to the circulation system in the City's CAP.

Transit, Bicycle, and Pedestrian Facilities

The Project would not conflict with any plans or policies regarding existing or proposed transit, bicycle, and pedestrian facilities in the study area. During construction, sidewalk closures around the perimeter may be expected during street improvements. During this time, pedestrians would generally be routed to the other side of the street, but temporary covered pedestrian routes would be provided for access to the existing hotels. There are no identified Safe Routes to School along streets fronting the Project site; therefore, the construction of the Project would not temporarily affect such routes. During long-term operations of the Project site, when residences are occupied with families, it is expected that some students would walk from the site to the local schools. Local public schools that would serve the Project site are located to the west and would not require students to cross the PCH or other major roadways.

There are no existing bicycle facilities that would be temporarily impacted by Project construction. The South Bay Bicycle Master Plan indicates that additional Class II and III bicycle facilities are planned along Mariposa Avenue. No plans for the completion of the additional Class II and II bicycle facilities are anticipated to occur during Project construction. Bus stops are located east of the Project site, on Mariposa Avenue and on PCH. Construction is not anticipated to affect bus operations as construction and staging would not be immediately adjacent to these bus stops. The Metro C Line and Mariposa Station are located over 0.5 miles from the Project site and would not be impacted by Project construction. Therefore, the Project construction would not require relocation of bus stops and the construction impacts on transit, bicycle, and pedestrian facilities would be less than significant.

Once operational, bicycle and pedestrian access to the Project site would not be affected as no new driveways are being added. Bicycle access to the Project site would continue to be available on Indiana Street, Mariposa Avenue, and PCH. Further, the Project would not preclude implementation of the South Bay Bicycle Master Plan, including any future plans to complete the additional Class II and II bicycle facilities on Mariposa Avenue. The bus stops and other transit facilities would not be affected by Project operations. Due to the distance between the Project site and the Metro C Line, and because the Project would not impact right of way currently used or planned to be used for bus or light rail activities, the Project would not conflict with any plans or policies related to transit. Given the various transit facilities available near the Project site, sufficient transit capacity in the study area is available. Therefore, the Project's impact on transit, bicycle, and pedestrian facilities would be less than significant.

Conflict with CEQA Guidelines Section 15064.3 (b)

State CEQA Guidelines Section 15064.3(b) focuses on newly adopted criteria (VMT) adopted pursuant to SB 743 for determining the significance of transportation impacts. The VMT per capita assumed for the Project site was therefore based on the vehicle trips and average trip lengths for the TAZ in which the Project is located from the SCAG model, which indicates a daily household VMT per capita of 10.9 for all home-based production trips within the TAZ.

For residential projects, OPR recommends that a project exceeding a level of 15% below existing daily household VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as

regional VMT per capita or as city VMT per capita. The SCAG regional daily household VMT per capita (15.3) is higher than the City's daily household VMT per capita (14.2). Therefore, to be conservative, existing daily household VMT per capita is measured against the City's daily household VMT per capita for this analysis.

Per the SCAG model, the existing City daily household VMT per capita for residential land uses are 14.2 per resident. The threshold of 15% below the City average is 12.1 daily household VMT per capita (i.e., per resident). The proposed Project is estimated to generate 10.9 daily household VMT per capita, which is lower than 15% below the existing City daily household VMT per capita. Therefore, proposed Project would not conflict with State CEQA Guidelines Section 15064.3(b) and impacts would be less than significant.

Hazards Due to Geometric Design Feature

Project access would not substantially increase hazards due to design features or incompatible uses. The Project would not result in the construction of new driveways; rather, the Project would allow for full access onto Mariposa Avenue, Palm Avenue, and Indiana Street, where access is currently limited to in-only/out-only. The proposed driveways at PCC-North would allow for full access in/out via Mariposa Avenue and Palm Avenue, and the existing curb cut on PCH would be removed. The residential access from Indiana Street at PCC-South would allow for full access in/out rather than access out-only, as under the existing conditions. No changes are proposed to access for the PCC-Fairfield Parking site. Additionally, as part of the Project, the eastbound leg of Mariposa Avenue at PCH would be reconfigured from one left lane and one through-right lane to one left, one through, and one right-turn lane.

All new driveways and internal access points would be designed and constructed to ensure appropriate line of sight and appropriate turning radii. Additionally, to ensure the Project would not result in driveway queueing onto PCH, a major corridor in the Project vicinity, which could create hazards to oncoming traffic, a queuing analysis was conducted for the PCH/Pacific Coast Commons South Driveway.

A queuing analysis, from within the Project site, was conducted for the driveway approach at the PCH/PCC-South driveway to show the estimated length of queues for vehicles exiting the Project site. Queues at the driveway are anticipated to be minimal given the volume of outbound Project trips at this driveway. Future plus Project Conditions, queues are anticipated to be minimal given the volume of outbound Project trips at this driveway. Therefore, the unsignalized and stop-controlled PCC-South driveway on PCH would not substantially increase hazards for vehicles using this Project access.

A signal warrant analysis conducted for the two unsignalized intersections at PCH and Palm Avenue and PCH and Holly Avenue, determined neither intersection trigger a signal warrant for both Existing plus Project and Future plus Project. Therefore, Project traffic at these intersections would not create increase hazards due to a geometric design feature or incompatible uses. Impacts would be less than significant.

Inadequate Emergency Access

Construction

Short-Term Construction Parking

An analysis of parking availability is not a requirement pursuant to CEQA. Vehicle access would be accommodated for the existing hotel uses on the Project site throughout the duration of construction. It is possible that the construction of PCC-Fairfield Parking, PCC-South, and PCC-North would occur sequentially. During Phase 1

construction, Fairfield Inn and Suites Hotel guests would continue to park at the existing surface lot at PCC-North. Once Phase 1 is completed, parking for the Fairfield Inn and Suites Hotel guests could be moved into the newly constructed garage. During Phase 2 construction, Aloft Hotel parking would be accommodated via the existing surface lot at PCC-North. Once Phase 2 is completed, PCC-South and its respective land uses would park on-site at the new garage. Phase 3, the North site, would begin construction and during this buildout no vehicles would need special parking accommodations. It is possible that Phase 2 and Phase 3 would be constructed at the same time. Under a concurrent timeline, Phase 1 would construct the replacement parking and new retail for the Fairfield Inn and Suites Hotel site adjacent to the existing hotel. During Phase 1, the Aloft Hotel and Fairfield Inn and Suites Hotel would continue to be in operation. During the construction of Phase 2 and Phase 3, both hotels would continue to operate, and new retail built in Phase 1 would be occupied. During Phase 1 of construction, Fairfield Inn and Suites Hotel and Aloft Hotel guests would continue to park at the existing surface lots at their respective sites. The existing Fairfield Inn and Suites Hotel surface lot has 232 parking spaces and the existing Aloft Hotel surface lot has 165 parking spaces, for a total of 397 parking spaces. During construction hours, a peak demand of 171 parking spaces for the Fairfield Inn and Suites Hotel and 119 parking spaces for the Aloft Hotel would need to be accommodated, along with a peak demand of 60 construction employee parking spaces. The total demand of 350 spaces would be entirely accommodated by the existing 397 spaces. However, only the newly-constructed PCC-Fairfield Parking structure (215 parking spaces) would be available for parking during PCC-South and PCC-North construction. Construction of Phases 2 and 3 would require 442 spaces, resulting in a deficit of 227 parking spaces.

As described under Development Agreements/Conditions of Approval above, if the total parking demand would exceed the total parking supply during construction activities, the Project applicant/developer would be required to accommodate the excess parking demand at an off-site location and provide shuttle service to and from the Project site accordingly to ensure that that parking is adequately provided during short-term construction activities.

Operation

All areas of the Project site would be accessible to emergency responders for the long-term operation of the proposed Project. Local access to the Project site would be provided via PCH, Indiana Street, Mariposa Avenue, and Palm Avenue. All of the Project access points would be confirmed to be designed according to applicable design standards. The proposed Project would provide adequate access to the Project site, including access for emergency vehicles. The internal drive aisles and loading and parking areas would be designed to comply with City's width, clearance, and turning radius requirements of the Fire Department. A fire access driveway would be constructed within PCC-North to provide access to the development.

The Specific Plan requires structures, roadways, and facilities to comply with applicable local, regional, state, and/or federal requirements related to emergency access and evacuation plans. The Project would require approval of a Site Plan Review No. 19-01 to allow the site plan and architectural design to construct the mixed-use commercial and residential development. Thus, all development proposed under the Specific Plan, including the proposed Site Plan, would be reviewed and approved during plan check review to ensure appropriate emergency access. Adherence to these requirements would ensure that impacts due to inadequate emergency access are below a level of significance. Therefore, potential impacts associated with inadequate emergency access would be less than significant.

Long-Term Shared Parking

An analysis of parking availability is not a requirement pursuant to CEQA.

The Shared Parking Analysis was conducted to determine the minimum amount of parking needed to adequately park the Project's proposed and existing land uses. This analysis assumes that a number of parking spaces on site can be shared between the residential guests, hotel guests, and patrons of the on-site retail and restaurant uses. Because a shared parking supply is proposed, the Project would not be providing excess parking spaces that could encourage the driving of non-residents to/from the site. In fact, the Project would be providing a parking supply lower than the City's Municipal Code requirements, but would adequately support the Project's parking demand through shared parking.

The PCC-North site plan proposes 253 parking spaces (with 12 of those spaces in individual garages), with 189 parking spaces reserved for residential tenant use. The remaining 51 spaces would be shared between the residential guest parking, commercial uses, and for overflow if needed from the other sites. PCC-North is projected to have a peak residential parking demand of 160 parking spaces and a peak shared parking demand of 49 spaces. As such, the PCC-North is projected to have a surplus of three shared parking spaces during the peak demand period.

The PCC-Fairfield Parking peak parking demand is estimated to be 191 spaces. The site plan proposes 215 parking spaces, indicating sufficient supply for the anticipated demand with a surplus of 24 spaces during the peak demand period.

The PCC-South site plan proposes 336 parking spaces, with 165 parking spaces reserved for residential tenant use. The remaining 171 spaces would be shared between the residential guest parking, hotel, commercial uses, and for overflow if needed from the other sites. The PCC-South is estimated to have a peak residential parking demand of 144 parking spaces and a peak shared parking demand of 192 spaces. As such, PCC-South would have a deficit of 21 shared parking spaces during the peak demand period. The excess demand can be accommodated by the surplus of spaces at the PCC-North and PCC-Fairfield Parking garages, which have a combined surplus of 26 spaces.

It is noted that the Specific Plan allows an adjustment to the parking requirements of Development Standard D1 if a separate parking study can justify the need for adjustments to parking. The shared parking analysis demonstrates that sufficient parking would be provided to meet the demand of the various uses on-site, as proposed by the site plan. The shared parking would serve to efficiently use available developable land and would avoid an "over-parked" Project that could inadvertently encourage single-occupancy vehicle use.

Cumulative Transportation Impacts

Plan, Program, Ordinance, or Policy Addressing Circulation

The proposed Project is consistent with the following plans addressing the circulation system and would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities under cumulative conditions. Therefore, cumulative impacts related to a program, plan, ordinance, or policy related to addressing the circulation system would be less than significant.

CEQA Guidelines Section 15064.3(b)

The long-term cumulative impacts related to VMT have been reviewed per the SCAG VMT thresholds. The Project is located within an urbanized area served by public transit. The Project would not exceed the SCAG threshold for

VMT; therefore, the Project's contribution to cumulative VMT would not be cumulatively considerable and would be a less-than-significant impact.

Hazardous Design Features

The Project would not result in the construction of new driveways; rather, the Project would allow for full access onto Mariposa Avenue, Palm Avenue, and Indiana Street, where access is currently limited to in-only/out-only. The proposed Project has a completed circulation analysis using a LOS methodology that indicates that the trips generated by the proposed Project would not result in adverse circulation conditions. Because the impacts related to Project access points and circulation are site specific, and would be less than significant, the Project would not contribute to cumulative impacts with respect to hazardous design features.

Emergency Access

The Project would not result in inadequate emergency access and Project impacts to emergency access would be less than significant. As with the proposed Project, driveways and/or circulation modifications proposed in the surrounding area would comply with applicable local, regional, state, and/or federal requirements related to emergency access and evacuation plans. Further, since modification to access are largely confined to the Project site and the immediately surrounding area, Project-specific emergency access impacts would likely not impact other cumulative projects. Therefore, the Project's contributions to cumulative impacts would be less than significant.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on transportation as it relates to conflict with circulation system plan, ordinance, or policy; conflict with CEQA Guidelines Section 15064.3 (b); inadequate emergency access; and cumulative impacts. Therefore, no mitigation is required, and no significant, unavoidable adverse impacts would occur.

2.4.17 Utilities and Service Systems

Require or Result in the Construction of New Water, Wastewater Treatment, Stormwater Drainage, Electric Power, Natural Gas, or Telecommunications Facilities

Water Service

The water service connection for domestic water and fire protection would be made to one or more of the existing City water lines surrounding each development area. The specific location of these connections and pipe sizing would be based upon the City's approval. The system would provide adequate water supply for operation of the building's domestic requirements, automatic sprinkler systems and on-site fire hydrants, if required by the state or City Fire Marshal. Fire flows for the proposed Project would be based on the requirements listed in the version of the California Fire Code that is in effect at the time of plan submission, as amended by the City. Impacts within the Project site as part of construction of the proposed Project have been evaluated throughout the Draft EIR. Thus, the construction of new fire hydrants within the Project site would not cause a significant environmental effect.

The proposed Project is located in the high pressure zone of the City. The results of the modeling identified the service size necessary for the Project as less than-inches for each of the sites. Because the modeled flows are much higher than the estimated flows and the results of the analysis for the higher modeled flows prove that the

City main does not need to be upsized, it can be concluded that the City main would have more than enough capacity for the lower estimated flows and will not need to be upsized. Therefore, impacts to water facilities would be less than significant.

Sanitary Sewer

The City's sanitary sewer lines are located on all sides of the proposed Project. New sewer laterals are proposed for all the new buildings. It is anticipated that the new sewer laterals would connect to several of the existing gravity lines surrounding the Project. The proposed Project does not currently impact the existing pressure lines. Both the existing and proposed project sewer flows are considered in the average dry weather flow. It was assumed that all commercial spaces would consist of restaurants, which generates the highest flow compared to other commercial uses. The total flow from the Project is estimated to be 40,330 GPD or 0.0403 MGD. It appears that all sewer systems analyzed would still flow less than 50% full with the additional flows from the Project and that the sewer systems have capacity to serve the new developments. Therefore, no upgrades to the existing sewer pipeline infrastructure would be required as a result of Project implementation. Impacts would be less than significant.

Stormwater Drainage

There are two existing storm drains near the Project site that are owned by Caltrans and the City. Infiltration is feasible for stormwater treatment, in compliance with City of El Segundo low-impact development requirements. Because the peak flow rate would be reduced in the proposed condition, it is assumed that the City of El Segundo storm drains will have more than enough capacity to handle the flow rate generated by the proposed Project. Therefore, no upgrades to the existing storm water drainage infrastructure would be required as a result of Project implementation. Impacts would be less than significant.

Dry Utilities

Natural gas is provided to the Project area by the SoCal Gas, and gas utility infrastructure is located in all streets adjacent to the Project site, including PCH, Palm Avenue, Mariposa Avenue, Indiana Street, and Holly Avenue. New connections would be required for all the new buildings. The existing gas service would be maintained and future gas service would be provided through the Project's private gas service line connections to the SoCal Gas utilities in the surrounding streets. SoCal Gas has confirmed that there are existing facilities in the area and that service would be provided to the Project site in accordance with applicable policies and rules set forth by the CPUC.

Electrical power is provided to the Project area by SCE. There are existing underground electrical lines below PCH and Mariposa Avenue adjacent to the Project site. New underground utility conduit systems would be needed to intercept the existing underground electric system and provide electrical power to the proposed improvements. Final locations and points of connection for the electrical system will be based on a final approved design, in coordination with SCE. SCE has confirmed that there are existing facilities in the area, and service would be provided to the Project site in accordance with applicable policies and rules set forth by the CPUC.

There are existing underground telecommunication lines below PCH, Palm Avenue, and Mariposa Avenue adjacent to the Project site. It is anticipated that Velocity and Sonify would continue to provide service to the Aloft Hotel and the Fairfield Inn and Suites Hotel. Verizon, CenturyLink, and Charter Communications have all confirmed that they have existing services in the area. New underground utility conduit systems would intercept the existing underground telecommunications system and provide services to the proposed buildings.

Upgrades to dry utilities could be required based on the change in land use (i.e., higher density and increase in onsite technology). Any required upgrades are anticipated to be limited the lateral connections to the Project site and not any centralized facilities. This significance criterion is generally applicable to projects that are not already served by municipal utilities, or for greenfield development projects outside of urban areas, because it is those projects that either need to construct new electrical power, natural gas, and telecommunication centralized facilities, or that would tax existing infrastructure.

Upgrades would be coordinated with appropriate service providers (such as SCE, SoCal Gas) to minimize disruptions on service and would be completed by either trenchless technology or open trenching to the depth of the underground utilities. Potential environmental impacts associated with trenching for utilities, including areas of temporary earth disturbance and the operation of construction equipment, are assessed throughout the Draft EIR. Additionally, the Project would be required to comply with all regulatory requirements and mitigation measures outlined within this draft EIR for the purposes of mitigating impacts associated with utility construction activities and the use of heavy machinery. No adverse physical effects beyond those already disclosed in this Draft EIR would occur as a result of implementation of the Project's proposed utility system connections. Therefore, impacts to dry utilities would be less than significant.

Sufficient Water Supplies

The estimated water demand for the proposed Project based on 120% of the estimated sewer demand for the Specific Plan area. The total domestic (potable) water demand from the Project is estimated to be 48,396 GPD or 0.048 MGD or 54.2 AFY. The proposed Project is estimated to require approximately 48,396 GPD (54.2 AFY) of new demand of potable water, based on the calculations provided in the Utility Report (Appendix G of the Draft EIR). Therefore, the Project's water demand would be far below the estimated 210 AFY benchmark for determining whether a Water Supply Assessment is required under SB 610 for a water use equivalent to a 500 dwelling unit development.

Although the proposed Project would not meet the threshold for the preparation of a Water Supply Assessment, it would generate a demand for potable water supplies that were not anticipated during the preparation of the City's 2015 UWMP, as the proposed Project would introduce new land uses that are not currently anticipated in the General Plan. The proposed Project's estimated 54.2 AFY would be approximately 0.31% of the City's overall supply total in 2025, and would be both within the estimates, and exceed the estimates, depending on whether it is a normal, wet, and multiple dry years.

The City of El Segundo will serve the proposed Project and will both provide and require the development to have redundant potable water connections, subject to the City's Water Department approval for all water connections. The City will charge various fees for providing potable water and wastewater services, which include but are not limited to readiness to serve, water usage (quantity), treatment, and utility user taxes.

The MWD is a primary source of water supply within Southern California. Because the City of El Segundo purchases the entirety of its water supply from the WBMWD, which is supplied through MWD, the reliability of the City's water supply is heavily dependent on the reliability analyses of these agencies. The amount of water the City obtains from these sources may vary from year to year, depending on weather conditions and demand. During multiple dry year scenarios, the demand exceeds the supply, however, WBMWD will be able to supply this difference. It was estimated in the MWD 2015 UWMP that surplus supplies are available to meet the increased demands during normal, dry, and multiple dry year scenarios through 2035. If the City uses more water than is naturally replenished during these years the City, WBMWD, and MWD can enact the measures outlined in their respective Water Shortage Contingency

Plans (WSCPs) to ensure that water is used as efficiently and sparingly as possible. This will help preserve the water supplies available, and ensure continued reliability for the future (City of El Segundo 2016).

While additional imported water from MWD can be purchased, if required, to address any additional demands, the City has also implemented measures to address potential water shortages. To respond to potential water supply shortages, including up to a 50% reduction in supply, the City has developed a four-stage rationing plan to be implemented if the City experiences a shortage in the water supply. Mandatory conservation is always required to prevent water waste. The City has also adopted a WSCP as part of its Municipal Code. The WSCP describes the measures to take in the event of a water shortage, including different stages of action corresponding to different levels of drought. Since the City of El Segundo receives its imported water supplies from the WBMWD and MWD, the City is also subject to the WSCPs of these Districts. Each District has water rationing stages and a WSCP that specifies the actions to be taken during a water shortage of 50% or greater. In the event that a water shortage becomes severe and a 50% reduction is necessary, the City will comply with the conservation measures as provided by the WBMWD and MWD WSCPs (City of El Segundo 2016).

WBMWD's 2015 UWMP has identified plans to reduce its imported water use by 17% within the next 20 years through diversifying its water sources; namely developing a full-scale ocean water desalination plant and expanding recycled water use. Water desalination is not included as a potential source in the City's UWMP because WBMWD would be the operator of the desalination plant; however, the City may be able to purchase desalination water as a part of the City's overall purchased water supply (City of El Segundo 2016). The WBMWD's environmental review of their Ocean Water Desalination Project was completed on November 20, 2019, which would include construction and operation of an ocean water desalination facility in El Segundo, with offshore ocean water intake and brine discharge structures, and an inland water conveyance system. The project would produce 20 MGD of potable drinking water and would provide a reliable local water supply, thereby offsetting the need for imported water from the SWP and increasing drought resiliency (WBMWD 2019b).

The City's UWMP must be updated every 5 years, and at the time of the preparation of this evaluation, the City is in the process of preparing the 2020 UWMP. Planned growth is incorporated into the supply and demand projections within the UWMP, in compliance with applicable regulations and standards. The Update to the UWMP would also consider changes to future supplies, such as desalination water. As described above (see Appendix G-2), the City would have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years (Xu pers. comm. 2020). Therefore, the City would have sufficient water supplies available to serve the proposed Project and reasonably foreseeable future development during normal, dry, and multiple dry years and impacts would be less than significant. No mitigation is required.

Adequate Capacity for Wastewater Treatment

Wastewater generated from the Project site would be treated at the HTP, which has the capacity to treat a maximum daily dry weather flow of 450 MGD of wastewater and a peak wet weather flow of 800 MGD, while on average dry weather days, the facility treats 275 MGD (City of Los Angeles 2020). The difference between the average dry weather flows and the maximum flows is 175 MGD. The City of El Segundo has an agreement with the City of Los Angeles that permits an average flow of 2.75 MGD of wastewater treatment and disposal capacity in HTP. Project wastewater discharges would be typical of the wastewater already generated at nearby properties; it would not include large quantities of unusual industrial/hazardous discharges that can interfere with the ability of a treatment plant meeting the water quality requirements for its discharges.

To be conservative, it was assumed that commercial areas of the proposed Project would consist of restaurants, which generate a higher demand of 1,000 GPD compared to other commercial spaces. Based on the Utility Report, the proposed Project would generate 40,330 GPD (0.0403 MGD) of sewer demand. This wastewater flow would represent approximately 1.46% of the City's permitted average flow to HTP, as well as would represent approximately 0.024% of HTP's remaining capacity. As such, the increase in wastewater generation attributable to the Project would be accommodated within the existing treatment capacity of the HTP and would represent a minimal to negligible percentage of the facility's remaining capacity. Additionally, the requirement to maintain capacity at HTP is monitored through permit requirements with the Los Angeles Regional Water Quality Control Board, which required the submittal of a report within 90 days after the "30-day (monthly) average" daily dry-weather flow equals or exceeds 75% of the design capacity of the plant (0.75 x 450 MGD = 337 MGD) of waste treatment and/or disposal facilities. This report must include A schedule for studies, design, and other steps needed to provide additional capacity for waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present units. Therefore, the Project would not result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitment. Furthermore, water conservation measures as established at the local and state level would be implemented and would help reduce the amount of wastewater generated by the Project. Therefore, impacts would be less than significant.

Generation of Solid Waste

Construction

The proposed Project would involve redevelopment of the existing surface parking lots of the Fairfield Inn and Suites Hotel and Aloft Hotel properties, as well as the Fairfield Inn and Suites Hotel Food and Beverage Building (formerly the Hacienda Restaurant). Redevelopment activities associated with the proposed Project would result in the generation of solid waste such as scrap lumber, concrete, residual wastes, packing materials, plastics, and soils. Per CALGreen standards, 65% of construction and demolition waste must be diverted from landfills (CalRecycle 2020b). As such, at least 65% of all construction and demolition debris from the site would be diverted. Additionally, any hazardous wastes that are generated during demolition and construction activities would be managed and disposed of in compliance with all applicable federal, state, and local laws. The remaining 35% of construction and demolition material that is not required to be recycled would either be disposed of in a regional landfill or voluntarily recycled at a solid waste facility with available capacity. The inert landfill in the County (Azusa Land Reclamation landfill) has a remaining capacity of 51,512,201 tons and is expected to remain open for approximately 25 years, as of 2020. Due to the temporary nature of construction and required compliance with the City's recycling mandates, construction would not generate waste in excess of standards or in excess of the capacity of local infrastructure and would not otherwise impair the attainment of solid waste reduction goals. Impacts would be less than significant.

Operation

Once operational, the proposed Project would produce solid waste on a regular basis, in association with operation and maintenance activities. The proposed Project would generate approximately 86.34 tons of solid waste per day. This amount assumes compliance with AB 939 requirements for 50% waste diversion from landfills. Solid waste generated by the proposed Project would be collected and transported to a local or regional landfill. Scholl Canyon landfill has a remaining capacity of 9,900,000 tons and is expected to remain open for another 10 years. Burbank Landfill Site No. 3 has a remaining capacity of 5,174,362 tons and is expected to remain open for another 33 years. Calabasas landfill has a remaining capacity of 14,500,000 tons and is expected to remain open for another 9 years.

The proposed Project is expected to generate approximately 86.34 tons per year. Collectively, the Scholl Canyon Landfill, Burbank Landfill Site No. 3, and the Calabasas Landfill have approximately 29,574,362 tons of available space remaining. As such, the net solid waste that is anticipated to be produced by the proposed Project would equate to approximately 0.00029% of the available capacity of the combined landfills through their estimated closure dates. This number would be further reduced in order to comply with CALGreen requirements for 65% waste diversion, which would require the Project Applicant/Developer to either submit a construction waste management plan to the City that identifies the C&D waste materials to be diverted from the landfills, or use a waste management company that can provide verifiable documentation that the percentage of C&D waste material diverted from the landfill meets CALGreen's 65% requirement

Once the Scholl Canyon Landfill, Burbank Landfill Site No. 3, and the Calabasas Landfill reach capacity, additional landfills and strategies would be identified so that disposal needs continue to be met. Furthermore, according to the latest annual report for the Countywide Integrated Waste Management Plan, there are landfills used by the County with up to 100 years of remaining life (County of Los Angeles Department of Public Works 2019). For example, the Prima Deshecha Sanitary Landfill in Orange County is expected to remain open for another 85 years, the Mesquite Regional Landfill in Imperial County is expected to remain open for another 100 years, and the Simi Valley Landfill in Ventura County is expected to remain open for another 67 years (CalRecycle 2020a). As such, in the event of closure of the Scholl Canyon Landfill, Burbank Landfill Site No. 3, and the Calabasas Landfill, other landfills in the region would be able to accommodate solid waste from the proposed Project, and regional planning efforts would ensure continued landfill capacity into the foreseeable future.

For the reasons described above, Project operations would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Impacts would be less than significant**.** No mitigation is required.

Solid Waste Statutes and Regulations

The proposed Project would be required to comply with all applicable local and state regulations related to solid waste. The solid waste facilities in proximity to the Project site, Scholl Canyon Landfill, Burbank Landfill Site No. 3, and the Calabasas Landfill, are regulated under federal, state, and local laws. Additionally, the City is required to comply with the solid waste reduction and diversion requirements set for in AB 939, AB 341, AB 1327, and AB 1826. Per AB 1826, businesses that generate 2 cubic yards or more of commercial solid waste per week are required to arrange for organic waste recycling services. Any hazardous wastes that are generated during construction activities would be managed and disposed of in compliance with all applicable federal, state, and local laws.

In addition to the City's requirements for recycling construction and demolition waste, the state has set a goal of 75% recycling, composting, and source reduction of solid waste by 2020. To help reach this goal, the state has adopted AB 341 and AB 1826. AB 341 is a mandatory commercial recycling bill, and AB 1826 is mandatory organics recycling. Waste generated by the proposed Project would enter the City's waste stream but would not adversely affect the City's ability to meet AB 341 or AB 1826, because the proposed Project's waste generation would represent a nominal percentage of the waste created within the City and because the businesses and residents at the Project site would be subject to recycling and diversion requirements. In addition, waste diversion and reduction during Project construction and operations would be completed in accordance with CALGreen standards, CalRecycle standards, City requirements, and the County Integrated Waste Management Plan. As a result, the Project would comply with federal, state, and local management and reduction statues and regulations related to solid waste. Impacts would be less than significant**.**

Cumulative Utilities and Service Systems Impact

Water

Implementation of the Project, in conjunction with cumulative projects would increase demand for water services provided in the City's water supply system. The Project area and each cumulative projects would incrementally increase the amount of water that is required in the area. However, as previously described, the existing water lines that serve the Project site have the capacity to convey the estimated peak flow generated from the Project. Similar to the Project, the capacity of water lines associated with cumulative project development would be determined on a project-specific basis. In the event that water line upgrades are required due to cumulative projects, all construction work within the City public rights-of-way would be subject to local municipal code and applicable agency requirements, and would be subject to CEQA review accordingly. Based on the analysis presented in the Utility Report (Appendix G of the Draft EIR), the proposed Project is not anticipated to contribute to a cumulative impact related to water infrastructure.

The City (through its UWMP) anticipates its projected water supplies will meet demand through the year 2035. In terms of the City's overall water supply condition, any cumulative project that is consistent with the City's General Plan has been taken into account in the planned growth of the water system. The City is currently preparing the 2020 UWMP, which is anticipated to be available in the Fall of 2021. The City's 2020 UWMP will account for anticipated growth within the City through 2040. Cumulative projects that propose changing the zoning or other characteristics beyond what is within the General Plan would be required to evaluate the change under necessary CEQA approval. The CEQA analysis would compare the existing to the proposed uses and the ability of the City and water utility providers to provide a sufficient level of water service.

For projects that meet the requirements established pursuant to SB 610, SB 221, and Sections 10910–10915 of the State Water Code, a Water Supply Assessment demonstrating sufficient water availability is required on a project-by-project basis. Similar to the Project, each cumulative project would be required to comply with City and State Water Code and conservation programs for both water supply and infrastructure to partially offset the cumulative demand for water. As a result, no significant cumulative water supply impacts are anticipated from development of the Project and cumulative projects, and the Project's incremental effect would not be cumulatively considerable. No mitigation is required.

Wastewater

The Project area and each cumulative project would incrementally increase the amount of wastewater that is being generated in the area. However, as previously described, the existing sewer lines that serve the Project site have the capacity to convey the estimated peak flow generated from the Project. Similar to the Project, the capacity of receiving sewer lines associated with cumulative project development would be determined on a project-specific basis. In the event that sewer upgrades are required due to cumulative projects, all construction work within the City public rights-of-way would be subject to local municipal code and applicable agency requirements, and would be subject to CEQA review accordingly. Based on the analysis presented in the Utility Report (Appendix G of the Draft EIR), the proposed Project is not anticipated to contribute to a cumulative impact related to sewer infrastructure.

Similarly, the proposed Project would generate 40,330 GPD (0.0403 MGD) of sewer demand. This wastewater flow would represent approximately 1.46% of the City's permitted average flow to HTP, as well as would represent approximately 0.024% of HTP's remaining capacity. As cumulative increases in wastewater treatment demand within the service area require facility upgrades, the City would continue to regulate public sewer facilities in

accordance with Title 12 of the El Segundo Municipal Code and the HTP would continue to assess potential expansions to their treatment facilities in accordance with regulatory permit requirements. As such, impacts to wastewater services would not be cumulatively considerable. No mitigation is required.

Electric Power, Natural Gas, and Telecommunication

The City of El Segundo is built-out and upgrades in electrical power, natural gas, and telecommunication capabilities are anticipated primarily due to development in the form of the revitalization of outdated or underserved areas, and redevelopment of specific properties that will increase density and require more sophisticated technology, such as the proposed Project. However, such upgrades would generally be confined to the lateral connections to the individual project sites and not any centralized facilities. Upgrades to centralized power, natural gas, and telecommunication facilities would be determined by each of the power, gas, and telecommunications providers, as build-out continues within the region. Individual projects would be required to provide for specific project needs. As a result, cumulative impacts associated with upgrades of electric, natural gas, and telecommunication facilities would not be significant. As such, impacts to electric power, natural gas, and telecommunication services would not be cumulatively considerable.

Solid Waste

Development of the Project in combination with cumulative projects would increase land-use intensities in the area, resulting in increased solid waste generation in the service area for the Scholl Canyon Landfill, Burbank Landfill Site No. 3, and the Calabasas Landfill. However, due to the built-out nature of the City, the Project and cumulative projects are considered urban infill and/or redevelopment projects. As such, solid waste is already being generated at the Project site and the majority, if not all, of the cumulative project sites. Further, AB 939, or the Integrated Waste Management Act of 1989, mandates that cities divert from landfills 50% of the total solid waste generated to recycling facilities. In order to satisfy CALGreen requirements of diverting 65% of solid waste and to offset impacts associated with solid waste, the proposed Project and all cumulative projects would be required to implement waste reduction, diversion, and recycling during both demolition/ construction and operation.

Through compliance with City and state solid waste diversion requirements, and due to the recycling collection process that would be part of the proposed Project design and the design of many typical urban infill projects, impacts to solid waste services would not be cumulatively considerable. Impacts would be less than significant, and no mitigation is required.

Finding

The City finds that, based upon substantial evidence in the record, the Project would have a less than significant impact on utility and service systems; therefore, no mitigation is required.

2.4.18 Wildfire

The Project site is in a highly urbanized area and is not within a Very High Fire Hazard Severity Zone and would not exacerbate or expose people or structures to wildfire risks or substantially impair an adopted emergency response plan. Based on the CAL FIRE's Fire Hazard Severity Zones maps (CAL FIRE 2020), the entire City, including the Project site, is not located in or near state responsibility areas or lands classified as Very High Fire Hazard Severity Zones. Therefore, impacts associated with wildland fire would not occur.

Finding

Appendix B of the Notice of Preparation for the Project found no potential for significant impacts to wildfire; therefore, wildfire was not addressed in the Draft EIR. No mitigation would be required and no significant, unavoidable adverse impacts would occur.

3 Findings on Project Alternatives

CEQA requires that an EIR describe a range of reasonable alternatives to the project, or to the location of the project, that could feasibly attain the basic objectives of the project, and to evaluate the comparative merits of the alternatives (14 CCR 15126.6[a]). The CEQA Guidelines direct that the selection of alternatives be governed by "a rule of reason" (14 CCR 15126.6[a], [f]). As defined by the CEQA Guidelines, "The range of alternatives required in an EIR is governed by a 'rule of reason' that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR needs to examine in detail only the ones that the Lead Agency determines could feasibly attain most of the basic objectives of the project" (14 CCR 15126.6[f]).

Additionally, CEQA Guidelines section 15091(a)(3) requires findings to be made as to why project alternatives were rejected. While an alternative may be potentially feasible under Guidelines section 15126.6 for inclusion in an EIR, the ultimate determination of feasibility is to be made by the decision-making body under section 15091(a)(3). As stated above, alternatives may be rejected when specific economic, legal, social, technological or other considerations make the Project infeasible. In making these findings, the City Council finds that there are six objectives for the Project, five of which are dependent upon intensifying the land use. However, the primary objectives of the Project are (1) addressing the regional housing shortage by providing additional housing opportunities, including affordable housing, that support the goals of the Housing Element of the General Plan, and (2) improving the job/housing balance in the City of El Segundo.

3.1 Alternatives Carried Forward for Consideration

This section discusses a reasonable range of alternatives to the Project, including a no project alternative, in compliance with CEQA Guidelines Section 15126.6(e). These alternatives include the following:

- Alternative A: No Project/Existing Development
- Alternative B: Reduced Development Alternative: Exclusion of PCC-North
- Alternative C: Reduced Development: Reduce 1 Level from PCC-South and PCC-North

These alternatives are evaluated for their ability to avoid or substantially lessen the impacts of the Project identified in the EIR, as well as consideration of their ability to meet the basic objectives of the proposed project as described in the Final EIR.

3.1.1 Alternative A - No Project/Existing Development

Section 15126.6(e) of the CEQA Guidelines requires that an EIR evaluate and analyze the impacts of a no project alternative. The "purpose of describing and analyzing a no project alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project" (14 CCR 15126.6[e][1]). When defining the no project alternative, the analysis shall be informed by "what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services" (14 CCR 15126.6[e][2]).

Description

The City's General Plan identifies the portion of the site that is south of Mariposa Avenue as General Commercial and the portion to the north of Mariposa Avenue as Parking. The zoning for the Project site corresponds to the designations of General Commercial (C-3) and Automobile Parking (P). According to the City's General Plan, the General Commercial designation permits all retail uses, including hotel uses, and major medical facilities, at a maximum floor area ratio (FAR) of 1.0. Office uses are not permitted except for those providing personal services not exceeding 5,000 square feet such as travel and insurance agents (City of El Segundo 1992). The City's General Plan parking designation permits areas for parking automobiles, motorcycles, and bicycles in surface or structured parking (City of El Segundo 1992). While hotel uses are allowed in the existing General Commercial (C-3) Zone, and the Fairfield Inn and Suites and the Aloft Hotels both have existing Conditional Use Permits, the two existing hotels do not comply with some of the development standards of the General Commercial (C-3) Zone because they were built prior to the current development standards. Thus, they are legal non-conforming as to building height, floor area ratio, and certain setback requirements. The Aloft Hotel is 98,741 net square feet in size with an existing 0.992 FAR based upon its current lot size and configuration where a maximum of 1.0 FAR is allowed. The three buildings that comprise the Fairfield Inn and Suites Hotel total 190,026 net square feet in size with an existing 1.94 FAR where 1.0 FAR is allowed (existing legal, non-conforming condition). Both properties are non-conforming in regard to many development standards as they were built prior to the current development standards of the General Commercial (C-3) Zone. Further, no further intensification of the land uses could occur with the current FAR standards. Therefore, the continuation of the City's General Plan would not allow for additional development to occur.

Section 15126.6(e)(3)(B) further states that "in certain instances, the no project alternative means 'no build' wherein the existing environmental setting is maintained." Accordingly, Alternative A assumes the proposed Project would not proceed, no new permanent development or land uses would be introduced within the Project site, and the existing environment would be maintained. The existing uses would continue to operate as they do currently. The existing hotel uses would remain in place and operational, the existing surface parking lots would be retained, no new buildings or parking garages would be constructed, no on-site landscaping improvements would occur, and no intersection improvements would occur.

Finding

Therefore, the City rejects the No Project/Existing Development as it fails to satisfy the Project's underlying purpose and to meet any of the Project objectives, and because specific economic, legal, social, technological or other considerations make the alternative infeasible.

Rationale

No Project/Existing Development would have fewer impacts compared to the Project in terms of aesthetics, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, noise, population and housing, public services, recreation, short-term transportation, tribal cultural resources, and utilities and service systems. The No Project/Existing Alternative would result in greater land use and planning impacts and long-term transportation impacts. The No Project/Existing Alternative would eliminate significant and unavoidable impacts related to air quality. In terms of achieving the Project objectives, the No Project/Existing Alternative would meet none.

3.1.2 Alternative B - Reduced Development Alternative: Exclusion of PCC–North

Description

Alternative B proposes a reduction in the Project to eliminate the significant impacts related to population growth projections and the AQMP, as well as lessen the proposed development intensity by eliminating PCC-North from the Specific Plan boundaries.

The Southern California Association of Government's (SCAG) forecasted population growth for the City of El Segundo is 500 persons between 2016 and 2045. Assuming 2.35 persons per household, the proposed Project's 263 residential units would accommodate 618 individuals at full occupancy of all units. If these 618 individuals would be new residents to the City, then the proposed Project would exceed SCAG's estimated projections through 2045 by 118 persons. Alternative B would not exceed SCAG's estimated projection through 2045. Considering the population growth anticipated in the 2016 RTP/SCS of 600 individuals within the City between 2012 and 2040, the proposed Project would result in a population growth in the City that would exceed the growth assumptions in the 2016 RTP/SCS, and would thereby exceed the population growth assumptions in the AQMP. Thus, Alternative B would eliminate an adequate amount of residential units to eliminate this significant and unavoidable impact.

All mitigation measures required under the proposed Project would be implemented prior to or during Project construction for all sites, with the exception of MM-HAZ-1, which is specifically related to PCC-North. Therefore, Alternative B is proposed as a reduced development alternative to exclude PCC-North. Under Alternative B, there would be no development north of Mariposa Avenue, which is included in the proposed Specific Plan as PCC-North. The Specific Plan would be prepared under Alternative B, excluding PCC-Mixed Use 2 (PCC-North) from the land use district. The PCC-North property would remain surface parking lot and no changes to the general plan land use designation or zoning would occur for that area.

Under Alternative B, there would be two phases of Project construction, similar to the proposed Project; however, Phase 2 would only involve construction of PCC-South, rather than PCC-South and PCC-North overlapping. Alternative B would include development of one multi-level parking garage, 120 residential units, and 5,756 square feet of commercial at PCC-South, and one multi-level parking garage and 3,273 square feet of commercial at PCC-Fairfield Parking, for a total of 120 units and 9,029 square feet of commercial, in addition to the continuation of the existing two hotels, as under the proposed Project.

Phase 1 for PCC-Fairfield Parking would include a five-level parking garage (65 feet in height) with commercial/retail on a portion of the ground floor fronting PCH, as set forth in the proposed Project. During Phase 1, all hotel guests would continue to park at surface parking lots north of Mariposa Avenue (PCC-North), which includes 232 parking spaces, as well as the parking lot north of Holly Avenue, which includes 165 parking spaces, for a total of 397 spaces. This would accommodate the peak parking demand at full occupancy for both hotels of 352 parking spaces. Once Phase 1 is completed, parking for the Fairfield Inn and Suites Hotel would move from PCC-North to the newly constructed garage at PCC-Fairfield Parking, which would include 215 replacement parking spaces for the Fairfield Inn and Suites Hotel and would be shared between the hotel and the commercial/retail uses. The 215 spaces from PCC-Fairfield Parking plus the 165 parking spaces at the surface parking lot for the Aloft Hotel, totaling 380 parking spaces, would provide adequate parking for the 352 hotel spaces and 28 spaces for the proposed 3,273 square feet of commercial at PCC-Fairfield Parking.

Phase 2 of development would include the construction of eight levels of parking garage (i.e., two levels of subterranean and six levels above ground) located behind the commercial/retail uses and adjacent to the existing Aloft Hotel and fronting PCH, as set forth in the proposed Project. During Phase 2, the Aloft Hotel would remain in operation and hotel patrons would park at the PCC-North lot (232 parking spaces), which can accommodate the demand of 145 vehicles at full hotel occupancy (Appendix J-2). Once Phase 2 is completed, parking for the Aloft Hotel would move from PCC-North to the eight-level parking garage, which would provide a total of 336 parking spaces, including 165 spaces for the residential units, and 171 shared spaces. The parking provided between the five-level parking garage at PCC-Fairfield Parking and the eight-level garage at PCC-South would be sufficient for the long-term operation of the proposed uses at both sites, in addition to the hotel parking.

Under Alternative B, the eastbound lane of Mariposa Avenue at PCH would be reconfigured in the same manner as the proposed Project, from one left lane and one through-right lane to one left, one through, and one right-turn lane.

Once operational, Alternative B would represent a reduction in proposed square footage, as well as a reduction in the overall footprint of Specific Plan area. Alternative B would reduce the Specific Plan total development square footage from 622,398 square feet to 437,398 square feet, to be located only within PCC-South and PCC-Fairfield Parking.

The exclusion of the PCC-North property from the Specific Plan under Alternative B, and the fact that PCC-South and PCC-Fairfield Parking would provide for all parking requirements for the proposed Specific Plan land uses, would make the surface parking lot at PCC-North available for other potential future uses. Potential future uses, if any, would be based on market conditions would likely require a future General Plan Amendment and zone change; however, any future uses at PCC-North would be too speculative for evaluation in this Draft EIR (State CEQA Guidelines Section 15145). Therefore, for the purposes of this analysis under Alternative B, it is assumed no changes to the PCC-North site would occur.

Finding

While Alternative B satisfies most of the Project Objectives, it does so to a lesser degree. Alternative B is rejected because specific economic, legal, social, technological or other considerations make the alternative infeasible.

Rationale

The Reduced Development Alternative: Exclusion of PCC–North would have fewer impacts compared to the Project in terms of air quality, energy, land use and planning, population and housing, public services, recreation, and transportation. The Reduced Development Alternative: Exclusion of PCC–North would be similar to the Project in terms on cultural resources, geology and soils, long-term hazards and hazardous materials, long-term hydrology and water quality, long-term transportation, and tribal cultural resources. The Reduced Development Alternative: Exclusion of PCC–North would reduce significant and unavoidable impacts related to air quality in relation to inconsistency with the AQMP. However, while the Reduced Development Alternative: Exclusion of PCC–North would meet all, with the exception of partially meeting one objective to facilitate a safe and walkable community along Pacific Coast Highway by providing a mix of land uses, including commercial at the street-level with residential uses above, it would do so to a lesser degree.

While the Project would still achieve most of the Project objectives, the objectives would not be achieved to the same extent and would not achieve the primary objectives. Since the time that this project was submitted, the City received its 6th Cycle Housing Element Regional Housing Needs Assessment. The City's allocation included 207

very low units and 99 low-income units. These allocations included a carryover of all of the lower income housing units that had been allocated to the City during the 5th Cycle of the Housing Element as no affordable housing was built during that time period at the former school site which was the City's primary strategy for meeting the RHNA for the 5th Cycle. The Project as proposed provides 32 of these lower income units, including 29% of the low-income allocation. Additionally, the City's housing stock is aging. Less than 7% was built in the last 20 years and more than 62% is more than 50 years old. From a policy perspective, Alternative B is infeasible because it would mean losing the opportunity for an additional 137 new housing units, including six condominium units, and would eliminate 17 affordable housing units. The need for affordable housing and improvement of the jobs/housing balance is critical. Additionally, Alternative B will do nothing to promote a walkable community along that portion of Pacific Coast Highway.

Alternative B is also not financially feasible. An independent development feasibility analysis commissioned by the City and conducted by Keyser Marston Associates determined that restricting 10% of the proposed residential units to affordable households would allow for a feasible project but would leave little ability to negotiate for additional benefits. Nevertheless, through the Development Agreement, the applicant has agreed to increase the affordable housing component to 12%. Additionally, the applicant has agreed to include one very low unit at PCC South and 2 very low units at PCC North. If PCC North is eliminated, then there are no apartments and condominiums to help offset the costs of PCC South and the PCC Fairfield parking structure, which is acknowledged to be costly due to its design.

3.1.3 Alternative C - Reduced Development: Reduce 1 Level from PCC-South and PCC-North

Description

Alternative C proposes to implement a reduced unit count on PCC-South and PCC-North to lessen population growth impacts and aesthetic impacts, and to eliminate the significant and unavoidable impact associated with conflicts with the AQMP. The Southern California Association of Government's forecasted population growth for the City of El Segundo is 500 persons between 2016 and 2045. Assuming 2.35 persons per household, the proposed Project's 263 residential units would accommodate 618 individuals. If these 618 individuals would be new residents to the City, then the proposed Project would exceed SCAG's estimated projections through 2045 by 118 persons. Alternative C would not exceed SCAG's estimated projection through 2045. Considering the population growth anticipated in the 2016 RTP/SCS of 600 individuals within the City between 2012 and 2040, which was used in the development of the AQMP, the proposed Project would result in a population growth in the City that would exceed the growth assumptions in the 2016 RTP/SCS, and would thereby exceed the population growth assumptions in the AQMP by 18 individuals. Alternative C would eliminate an adequate number of residential units to eliminate this significant and unavoidable impact.

Alternative C would not include Level L-5 from PCC-South and PCC-North, which contain 25 units and 29 units, respectively (see Figure 3-4E, PCC-South Levels L-2 to L-5 and Figure 3-6D, PCC-North Levels L-2 to L-5). Therefore, Alternative C would accommodate 491 individuals. Level L-5 contains 34 spaces on PCC-South and 39 parking spaces on PCC-North. Thus, parking would be reduced from 336 to 302. Additionally, Alternative C would reduce PCC-South from 84 feet to 74 feet in height from finished grade to the highest point of measurement and would reduce PCC-North from 78 feet to 68 feet in height from finished grade to the highest point of measurement.

Once operational, Alternative C would represent a reduction in proposed square footage; however, the footprint of the building area would remain the same. Alternative C would reduce the Specific Plan total development square footage from 622,398 square feet to 584,686 square feet, excluding parking.

Finding

Therefore, the City rejects the Reduced Development: Reduce 1 Level from PCC-South and PCC-North as specific economic, legal, social, technological or other considerations make the alternative infeasible. While Alternative B satisfies most of the Project objectives, it does so to a lesser degree. Alternative B is rejected because specific economic, legal, social, technological or other considerations make the alternative infeasible.

Rationale

The Reduced Development: Reduce 1 Level from PCC-South and PCC-North would have fewer impacts compared to the Project in terms aesthetics, air quality, energy, greenhouse gas emissions, long-term noise, population and housing, public services and recreation, long-term transportation, and utilities and service systems. The Reduced Residential Alternative would be similar to the Project in terms on cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, short-term noise, short-term transportation, and tribal cultural resources. The Reduced Development: Reduce 1 Level from PCC-South and PCC-North would reduce significant and unavoidable impacts related to air quality.

While the Project would still achieve most of the project objectives, the objectives would not be achieved to the same extent and would not achieve the primary objectives. Since the time that this project was submitted, the City received its 6th Cycle Housing Element Regional Housing Needs Assessment. The City's allocation included 207 very low units and 99 low-income units. These allocations included a carryover of all of the lower income housing units that had been allocated to the City during the 5th Cycle of the Housing Element as no affordable housing was built during that time period at the former school site which was the City's primary strategy for meeting the RHNA for the 5th Cycle. The Project as proposed provides 32 of these lower income units, including 29% of the low-income allocation. Additionally, the City's housing stock is aging. Less than 7% was built in the last 20 years and more than 62% is more than 50 years old. From a policy perspective, Alternative C is infeasible because it would mean losing the opportunity for an additional 54 new housing units and would reduce the number of new units that could be made available to lower income households. The need for affordable housing and improvement of the jobs/housing balance is critical.

3.2.4 Environmentally Superior Alternative

An EIR must identify an "environmentally superior" alternative; and, where the no project alternative is environmentally superior, the EIR is then required to identify an alternative from among the others evaluated as environmentally superior (14 CCR 15126.6[e][2]).

Alternative A would result in reduced environmental impacts to all environmental topics in the short-term because construction activity would not occur. Similarly, Alternative A would result in reduced environmental impacts to all environmental topics in the long-term, including elimination of the significant unavoidable impact related to conflicts with the AQMP, because no operational changes would occur. Although, no mitigation measures would be required for Alternative A, the two hotels would continue to be inconsistent with applicable zoning and land use regulations for the Project site. Under Alternative A, the Project site would remain in its existing condition and potential benefits of the proposed Project related to providing new living and working opportunities in close proximity

to transit would not occur. Additionally, the proposed Project would redevelop surface parking lots and construct a mix of land uses including residential and commercial, which would help the City to achieve its goals and policies related to land use, circulation, economic development, and housing, which would not occur under Alternative A. Nevertheless, the elimination of all construction and operational impacts associated with the proposed Project would result in a more environmentally superior alternative when compared to the proposed Project, Alternative B, or Alternative C.

As required under CEQA Guidelines Section 15126.6(e)(2), if the environmentally superior alternative is the "no project" alternative, the EIR must also identify an environmentally superior alternative among the other alternatives

Alternative B would reduce short-term construction-related impacts when compared to the proposed Project for all environmental topics. Alternative B would eliminate the necessity of MM-HAZ-2 since no development would occur at PCC-North. For long-term operational impacts, most environmental factors would have similar, albeit reduced, impacts under Alternative B to the proposed Project. Alternative B would have similar impacts to the proposed Project in the six areas: cultural resources, geology and soils, long-term hazards and hazardous materials, long-term hydrology and water quality, land use and planning, short-term transportation and tribal cultural resources. Alternative B would eliminate the significant unavoidable impact related to conflicts with the AQMP.

Alternative C would not eliminate any mitigation measures required under the proposed Project. Additionally, Alternative C would have similar impacts to the proposed Project in ten areas: cultural resources, geology and soils, short- and long-term hazards and hazardous materials, short- and long-term hydrology and water quality, land use and planning, short-term noise, short-term transportation, and tribal cultural resources. Alternative C would eliminate the significant unavoidable impact related to conflicts with the AQMP.

Because Alternative B would eliminate the need for MM-HAZ-2 and would reduce the intensity of development and the population growth when compared to both the proposed Project and Alternative C, Alternative B would be the environmentally superior alternative.

INTENTIONALLY LEFT BLANK

4 General CEQA Findings

Based on the information contained in the administrative record and based on the facts stated below, the City makes the Findings set forth in Sections 4.1 and 4.2.

1. The plans for the proposed project have been prepared and analyzed so as to provide for public involvement in the planning and the CEQA processes.
2. To the degree that any impacts described in the Draft EIR are perceived to have a significant effect on the environment, or such impacts appear ambiguous as to their effect on the environment, any significant effect of such impacts has been substantially lessened or avoided by the mitigation measures set forth in the Draft and Final EIR.
3. Comments regarding the Draft EIR received during the public review period have been adequately addressed in Chapter 2, Responses to Comments Received, in the Final EIR. Any significant effects described in such comments were avoided or substantially lessened by the mitigation measures described in the Draft and Final EIR.

4.1 Findings Regarding Recirculation

The City finds that the Draft EIR does not require recirculation under CEQA (CEQA Section 21092.1, CEQA Guidelines Section 15088.5). CEQA Guidelines Section 15088.5 requires recirculation of an EIR prior to certification of the Final EIR when "significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review." As described in CEQA Guidelines Section 15088.5:

> New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation includes, for example, a disclosure showing that:
>
> 1. A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented;
> 2. A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance;
> 3. A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it;
> 4. The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

In addition, CEQA Guidelines Section 15088.5(b) provides that "recirculation is not required where the new information added to the EIR merely clarifies and amplifies or makes insignificant modifications in an adequate EIR." Recirculation also is not required simply because new information is added to the EIR — indeed, new information is oftentimes added given CEQA's public/agency comment and response process and CEQA's post-Draft EIR circulation requirement of proposed responses to comments submitted by public agencies. In short,

recirculation is "intended to be an exception rather than the general rule." *(Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1132.)

As such, the City makes the following Findings:

1. None of the public comments submitted to the City regarding the Draft EIR present any significant new information that would require the Draft EIR to be recirculated for public review.
2. No new or modified mitigation measures are proposed that would have the potential to create new significant environmental impacts.
3. The Draft EIR adequately analyzed project alternatives and there are no feasible project alternatives or mitigation measures considerably different from others previously analyzed that would clearly lessen the significant environmental impacts of the project.
4. The Draft EIR was not fundamentally and basically inadequate and conclusory in nature and did not preclude meaningful public review and comment.

In this legal context, the City finds that recirculation of the Draft EIR prior to certification is not required. In addition to providing responses to comments, the Final EIR and Additional Responses include revisions to expand upon information presented in the Draft EIR (Chapter 3, Changes to the EIR); explain or enhance the evidentiary basis for the Draft EIR's findings; update information; and to make clarifications, amplifications, updates, or helpful revisions to the Draft EIR. These revisions, clarifications and/or updates do not result in any new significant impacts or increase the severity of a previously identified significant impact. These changes are not substantial, do not deprive the public of a meaningful opportunity to comment on a substantial adverse environmental effect, a feasible way to mitigate or avoid such an effect or a feasible project alternative.

In sum, the Final EIR and Additional Responses demonstrates that the proposed project would not result in any new significant impacts or increase the severity of a significant impact, as compared to the analysis presented in the Draft EIR. The changes reflected in the Final EIR also do not indicate that meaningful public review of the Draft EIR was precluded in the first instance. Accordingly, recirculation of the EIR is not required as revisions to the EIR are not significant as defined in Section 15088.5 of the CEQA Guidelines.

4.2 Legal Effects of Findings

To the extent that these Findings conclude that the proposed mitigation measures outlined herein are feasible and have not been modified, superseded, or withdrawn, the City hereby commits to implementing these measures. These Findings, in other words, are not merely informational, but rather constitute a binding set of obligations that will come into effect when the City approves the proposed project.

The mitigation measures that are referenced herein and adopted concurrently with these Findings will be effectuated through the process of construction and implementation of the proposed project.

5 Statement of Overriding Considerations

Pursuant to California Public Resources Code, Section 21081(b), and CEQA Guidelines Section 15093(a) and (b), the decision-making agency is required to balance, as applicable, the economic, legal, social, technological, or other benefits of the project against its unavoidable environmental risks when determining whether to approve a project. If the specific economic, legal, social, technological, or other benefits of the project outweigh the unavoidable adverse environmental effects, those effects may be considered "acceptable" (14 CCR 15093 (a)). CEQA requires the agency to support, in writing, the specific reasons for considering a project acceptable when significant impacts are not avoided or substantially lessened. Those reasons must be based on substantial evidence in the Final EIR or elsewhere in the administrative record (14 CCR 15093(b)).

Courts have upheld overriding considerations that were based on a variety of policy considerations including, but not limited to, new jobs, stronger tax base, and implementation of an agency's economic development goals, growth management policies, redevelopment plans, the need for housing and employment, conformity to community plan, and provision of construction jobs, See *Towards Responsibility in Planning v. City Council* (1988) 200 Cal App. 3d 671; *Dusek v. Redevelopment Agency* (1985) 173 Cal App. 3d 1029; *City of Poway v City of San Diego* (1984) 155 Cal App. 3d 1037; *Markley v. City Council* (1982) 131 Cal App.3d 656. In accordance with the requirements of CEQA and the CEQA Guidelines, the City finds that the mitigation measures identified in the Final EIR and the MMRP, when implemented, will avoid or substantially lessen virtually all of the significant effects identified in the Final EIR for the Pacific Coast Commons Specific Plan. However, certain significant impacts of the proposed project are unavoidable even after incorporation of all feasible mitigation measures. These significant unavoidable impacts result from air quality impacts due to conflict with SCAQMD 2016 AQMP (see Section 2.2).

The City finds that all feasible mitigation measures identified in the Final EIR that are within the purview of the City would be implemented with the proposed project. As identified below, the City further finds that the remaining significant unavoidable effects are outweighed and are found to be acceptable due to the following specific overriding economic, legal, social, technological, or other benefits, based upon the facts set forth above, the Final EIR, and the record.

The City finds that any one of the benefits set forth below is sufficient by itself to warrant approval of the proposed project. This determination is based on the findings herein and the evidence in the record. Having balanced the unavoidable adverse environmental impacts against each of the benefits, the City hereby adopts this Statement of Overriding Considerations for the following reasons:

a. The proposed project would maintain the existing hotel uses while providing for a mixed-use multiple-family and commercial neighborhood.
b. The proposed project would provide additional housing opportunities that support the goals of the Housing Element of the City's General Plan, including facilitating the development of affordable housing units and meeting the City's Regional Housing Needs Allocation.
c. The proposed project would improve the jobs/housing balance in the City of El Segundo, help address the regional housing shortage, and support and retain existing businesses by providing needed housing for employees.
d. The proposed project would enhance bicycle, pedestrian and vehicular circulation through roadway intersection improvements that facilitate a safe and walkable community along Pacific Coast Highway including:

1. Construction of a right-turn only lane from eastbound Mariposa Avenue onto southbound Pacific Coast Highway and widening of the two existing eastbound lanes;
2. Widening and sidewalk reconstruction along Holly Avenue between Pacific Coast Highway and Indiana Street;
3. Installation of street trees along Pacific Coast Highway, Holly Avenue, Indiana Street, Mariposa Avenue, and Palm Avenue; and
4. Installation of public seating along Pacific Coast Highway.

e. The proposed project would eliminate underutilized surface parking lots and provide parking garages that allow for sharing among hotel, commercial, and residential land uses in order to allow the development of needed housing units as well as retain services and restaurant uses to serve the neighboring residents and businesses.

f. The proposed project would reduce single-occupancy vehicle use by providing a mix of land uses in walkable proximity to the Metro C Line, existing bus routes, and the City's downtown.

g. The proposed project is consistent with the City's housing strategy to direct growth in regional centers and areas near transit stations, major bus centers, and bus stops along major bus routes. The proposed project is also consistent with regional growth strategies, such as the SCAG 2020-2045 Regional Transportation Plan and Sustainable Communities Strategy, by increasing density within the Plan area.

h. The proposed project would implement the majority of the proposed measures by the California Air Pollution Control Officers Association (CAPCOA) to reduce GHG emissions, which also reduce criteria pollutants.

On balance, the City finds that there are specific economic, legal, social, technological, and other considerations associated with the proposed project that serve to override and outweigh the significant unavoidable effects of the proposed project and, thus, the adverse effects are considered acceptable. Therefore, the City hereby adopts this Statement of Overriding Considerations.

6 Conclusion

The mitigation measures listed in conjunction with each of the findings set forth above, as implemented through the MMRP, will eliminate or reduce to a less-than-significant level most of the adverse environmental impacts of the Project. The significant and unavoidable impacts of the Project would be rendered acceptable by the specific economic, legal, social, technological, or other benefits identified in Section 5, Statement of Overriding Considerations.

Taken together, the EIR which consists of the Draft EIR, Final EIR, and the Additional Responses, the mitigation measures, and the MMRP provide an adequate basis for approval of the Project.

INTENTIONALLY LEFT BLANK

RESOLUTION NO. 2906

A RESOLUTION RECOMMENDING THAT THE CITY COUNCIL (1) RESCIND THE APPROVALS OF SUB NO. 14-05, LOT TIE COVENANT NO. MISC 14-03 AND OFF-SITE PARKING COVENANT NO. MISC 14-06; (2) AMEND CONDITIONAL USE PERMIT NO. 14-01 TO ALLOW THE CONTINUED OPERATION OF AN EXISTING 350-ROOM HOTEL (NORTH HOTEL SITE OF THE FORMER HACIENDA HOTEL PROPERTY) IN ADDITION TO THE PREVIOUSLY APPROVED ALCOHOL SERVICE AT 525 NORTH PACIFIC COAST HIGHWAY; AND (3) APPROVE OFF-SITE PARKING FOR THE NORTH HOTEL SITE

(PROJECT NO. EA-1248; MODIFICATION OF CONDITIONAL USE PERMIT NO. CUP 14-01; AND OFF-SITE PARKING).

(NORTH HOTEL)

The Planning Commission of the City of El Segundo does resolve as follows:

SECTION 1: The Commission finds and declares that:

A. On October 9, 2014 the Planning Commission approved Resolution No. 2759 approving an application to modify the then 619-room Hacienda Hotel into two hotels, a 350-room north hotel site (the "North Hotel") and a 246-room south hotel site (the "South Hotel"). Along with approving this modification, Resolution No. 2759 approved an amendment to an existing conditional use permit (CUP No. 87-01) to allow operation of a bar serving alcohol (BAR 525), and alcohol service in meeting, banquet and breakfast rooms, the pool and patio area, and alcohol sales in the hotel convenience market in the North Hotel (the amended conditional use permit is designated CUP No. 14-01), a tentative map to reconfigure the existing lots into two separate parcels for the North Hotel and South Hotel (SUB No. 14-05), an off-site parking covenant to permit 213 off-site parking spaces for the North Hotel in a surface parking lot located north of Mariposa Avenue (Off-Site Parking Covenant No. MISC 14-06) and a lot-tie covenant holding the existing three parcels underlying the existing off-site parking lot as one property for parking purposes (Lot Tie Covenant No. MISC 14-03). The property owner never recorded the map.

B. Subsequent to the approvals listed above, the property was sold on May 13, 2019. BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC (collectively "BRE") filed several applications to develop the hotel properties with a mixed-use development known as the Pacific Coast Commons Specific Plan. Under the proposed Specific Plan, hotels will be allowed as a conditionally permitted use. BRE's application includes a request to amend the existing Conditional Use Permit (CUP No. 14-01) for the North Hotel Site (Fairfield Inn and Suites Hotel) located at 525 Pacific Coast Highway (the "Project

Site") to allow the continued use of the hotel, the continued alcohol service in the existing bar, (BAR 525), meeting, banquet and breakfast rooms, in the pool and patio area, alcohol sales in the convenience market in the hotel, and the modification of the off-site parking.

C. As part of the Pacific Coast Commons Specific Plan, the City Council will consider Vesting Tentative Map. No. 82806 that will combine the 12 existing parcels comprising the hotel properties into 4 parcels and create two parcels at the north parking lot site that is currently comprised of 3 parcels held together by a lot-tie covenant. Additionally, the Council will consider a Shared Parking Agreement in conjunction with a Parking Demand Study and Shared Parking Analysis to establish the parking requirements among the various uses.

D. The Pacific Coast Commons Specific Plan Project (the "Project") includes the discretionary actions contemplated herein and all of the discretionary actions required for the Project are collectively identified as Environmental Assessment No. EA-1248.

E. The Project has been reviewed by the City's Development Services Department for, in part, consistency with the General Plan and conformity with the El Segundo Municipal Code ("ESMC");

F. In addition, the City reviewed the Project's potential environmental impacts under the California Environmental Quality Act (Public Resources Code §§ 21000, *et seq.*, "CEQA") and the regulations promulgated thereunder (14 Cal. Code of Regulations §§15000, *et seq.*, the "CEQA Guidelines");

G. The Development Services Department completed its review and scheduled a public hearing regarding the application before this Commission for November 18, 2021; along with consideration of all the approvals required for the Pacific Coast Commons Specific Plan project including Environmental Assessment No. EA-1248;

H. On November 18, 2021, the Commission held a noticed public hearing to receive public testimony and other evidence regarding the application including, without limitation, information provided by BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC and its representatives;

I. On November 18, 2021, the Planning Commission continued the public hearing to December 9, 2021;

J. On December 8, 2021 a letter was submitted to the City by Mitchell M. Tsai, Attorney At Law, on behalf of the Southwest Regional Council of Carpenters ("Carpenters' Letter") objecting to the Project and referring to an earlier letter which had never been received by the City which raised issues with the EIR; and

K. Based on the submission of the Carpenters' Letter the City determined that it would be necessary to continue the hearing to allow time to respond, but nevertheless took testimony on December 9, 2021; and

L. During the public testimony portion of the hearing, a letter was submitted by the Lozeau Drury law firm on behalf of Supporters Alliance For Environmental Responsibility ("SAFER letter");

M. On February 10, 2022, the Planning Commission held a new duly noticed public hearing to receive public testimony and other evidence regarding the application;

N. The Commission considered the information provided by City staff, public testimony, and the representatives for the applicant; and

O. This Resolution, and its findings are made based upon the entire administrative record including, without limitation, testimony and evidence presented to the Commission at its November 18, 2021, December 9, 2021, and February 10, 2022 public hearings including, without limitation, the staff reports submitted by the Development Services Department.

SECTION 2: *Factual Findings and Conclusions*. The Planning Commission finds that the following facts exist:

A. The North Hotel is comprised of one five-story hotel building, one nine-story hotel building, and a two-story conference center ("food and beverage building"). The existing 350-room hotel will be located in the Pacific Coast Commons Specific Plan (PCCSP) Zone upon adoption of the Pacific Coast Commons Specific Plan.

B. The North Hotel site consists of six legal lots. The hotel site is located on the west side of Pacific Coast Highway and includes the northern half of the block between East Mariposa Avenue to the north, East Holly Avenue to the south and Indiana Street to the east. The North Hotel site will consist of one lot (Lot 3) after the recordation of Vesting Tentative Map No. 82806. The total lot area will be 67,487 square feet.

C. The North Hotel utilizes two parking area. Currently, parking is provided through a combination of 33 on-site parking spaces and 213 off-site parking spaces at the existing hotel surface parking lot immediately north of Mariposa Avenue with three driveway access points from Pacific Coast Highway, Holly Avenue and Indiana Street. The parking at the 236-space surface parking lot north of Mariposa is provided through an off-site parking covenant. A Shared Use Parking Agreement will replace the off-site parking covenant after the recordation of Vesting Tentative Map No. 82806. After construction of the Fairfield Parking Structure that will be located on the newly created lot immediately north of the Fairfield Inn and Suites hotel, 26

parking spaces will remain on site. The remainder of the parking will be provided off-site at the Fairfield Parking Structure with additional overflow parking provided through the Shared Use Parking Agreement. When the Pacific Coast Commons project is built out there will be parking structures on Lots 1, 4 and 5 of Vesting Tentative Map No. 82806, which will accommodate parking for the North Hotel, the South Hotel, other commercial uses and the multiple-family residential development. A Shared Use Parking Agreement will be recorded to share parking for any overflow needs for the hotel, other commercial uses, and multiple-family residential guest parking within the Pacific Coast Commons Specific Plan.

D. The North Hotel includes an existing bar with alcohol service. The applicant sells a full line of alcoholic beverages for consumption in the following locations in the North Hotel: bar; meeting, banquet and breakfast rooms, and the pool and patio area. The applicant sells beer and wine in a hotel convenience market. Conditional Use Permit No. 14-01 for alcohol service runs with the land and will continue to allow sales between the hours of 6 a.m. and 2 a.m. daily. The applicant has a California Department of Alcoholic Beverage Control for a Type 47 license (on-site beer, wine and distilled spirits).

E. The Project includes a request to amend the existing North Hotel conditional use permit (CUP No. 14-01) to be applicable to the North Hotel and its existing associated alcohol uses (for on-site sales of beer, wine and distilled spirits and sales of beer and wine in the hotel convenience market) in order to be consistent with the conditionally permitted uses allowed with the adoption of the Pacific Coast Commons Specific Plan (PCCSP).

SECTION 3: *Environmental Assessment*. The modifications set forth in this Resolution were part of the overall Pacific Coast Commons Project analyzed as part of EA-1248. An environmental impact report was prepared for the project and, by separate resolution (Resolution No. 2905), the Planning Commission has recommended that the City Council certify the Final Environmental Impact Report. The findings and recommendation set forth in Resolution No. 2905 and are incorporated herein by reference.

SECTION 4: *General Plan Findings*. The changes approved by this resolution will further the goals, policies and objectives of the General Plan and will not obstruct their attainment. Specifically:

A. The hotel use and alcohol use are existing uses and are conditionally permitted in the Pacific Coast Commons Specific Plan.

B. The hotel use is consistent with Economic Development Element Policy ED 1-2.2 to “maintain and promote land uses that improve the City’s tax base, balancing economic development and quality of life goals.” The existing renovated hotel facility has resulted in a site that improves the City’s tax base because the hotel is a more attractive destination to visitors, which has improved occupancy and room rates. The North Hotel contributes to the

City's quality of life as it improves the appearance of existing hotel buildings located on Pacific Coast Highway, the City's major commercial corridor.

C. The North Hotel is consistent with Circulation Element Objective C3-2 to "ensure the consideration of the impacts of land use decisions on the City's parking situation." The Project will provide parking in compliance with the parking requirements established in the Pacific Coast Commons Specific Plan and the Parking Demand Study and Shared Use Analysis for the hotel and other planned uses. Currently, parking is provided through a combination of 33 on-site parking spaces and 213 off-site parking spaces at the existing hotel surface parking lot north of Mariposa Avenue. The parking at the surface parking lot north of Mariposa is provided through an off-site parking covenant. A Shared Use Parking Agreement will replace the off-site parking covenant after the recordation of Vesting Tentative Map No. 82806. The Fairfield Inn and Suites hotel will have direct pedestrian access from the hotel lobby to an entrance to the Fairfield Parking Structure across the driveway.

D. Noise Element Objective N1-2 to ensure that City residents are not exposed to stationary noise levels in excess of El Segundo's Noise Ordinance standards." The North Hotel is required to operate in compliance with the City's noise ordinance.

SECTION 5: *Conditional Use Permit Amendment Findings.* Pursuant to ESMC § 15-23-6, the Planning Commission finds that amending CUP No. 14-01 to allow for the continued use of the North Hotel with alcohol service is appropriate based on the following:

A. The North Hotel with alcohol service meets the objectives of ESMC Title 15 and the purposes of the zone in which the site is located. The PCC COM-3 Land Use District in the Pacific Coast Commons Specific Plan (PCCSP) Zone allows for a hotel as a conditionally permitted use. A bar serving alcohol is a typical accessory use in a hotel and is also allowed in the PCC COM-3 Land Use District pursuant to a conditional use permit. The hotel including the bar are existing uses. A bar is a typical amenity for this class of hotel. The alcohol service at the existing bar, meeting, banquet and breakfast rooms, and in the outdoor pool and patio area, as well as the alcohol sales in the convenience market in the hotel is appropriate for a hotel use. Therefore, the proposed location meets the objectives of the Pacific Coast Commons Specific Plan (PCCSP) Zone and Title 15.

B. The North Hotel and the continued service of alcohol will not be detrimental to the public health, safety or welfare, or materially injurious to properties or improvements in the vicinity. The existing hotel has been in operation at the site for over 64 years. The proposed amendment will not change hotel operations at the North Hotel site in any significant manner. The bar must be operated in a manner consistent with the conditions of approval as well as with ESMC noise and nuisance standards. The alcohol service proposed for the North Hotel will be the same as existing operating conditions.

Compliance with project conditions of approval, ABC requirements, and ESMC noise and nuisance requirements will result in a conditional use not detrimental to public health, safety and welfare.

C. The North Hotel and the continued service of alcohol will comply with each of the applicable provisions of ESMC Chapter 15-23. The bar serving alcohol in the North Hotel is compatible with the hotel use at the site. The existing hotel has been in operation approximately 64 years and has had alcohol service over this time. The North Hotel alcohol service in the existing indoor bar as well as the meeting, banquet and breakfast rooms and the alcohol sales in the hotel convenience market are screened from view and have no visual or noise impacts on other uses, including residential uses, in the general vicinity. Outdoor alcohol service around the patio and pool area are screened from nearby residential and commercial neighbors by on-site buildings and walls. Any noise generated in the outdoor alcohol service areas are subject to ESMC Chapter 7-2 “Noise and Vibration” requirements. Impacts such as smoke, dust, or fumes are not associated with the requested conditional use. Furthermore, the use will generate traffic generally consistent with the existing operation of the site, as the site currently is developed as a hotel with alcohol service.

D. The North Hotel must comply with State of California Department of Alcohol Beverage Control licensing requirements and maintain all applicable licenses.

E. The North Hotel with alcohol service is compatible with the particular use of the site and with other existing and potential uses in the general area. The long-established hotel use at the site is compatible with alcohol service. The hotel with alcohol service has been operating at the site for approximately 64 years and a hotel is a compatible use for a major commercial thoroughfare. The alcohol service operations at the North Hotel is not different from current hotel operations at the site. Indoor alcohol service will have no impact or adjacent residential properties. Outdoor alcohol service will be screened from adjacent residential properties.

F. The use is consistent and compatible with the purpose of the PCCSP Zone in that this zone allows for a range of commercial uses such as office, hotels, restaurants, retail, and on-site and off-site alcohol sales. A hotel with alcohol service including a bar serving alcohol is consistent with the purpose of this commercial zone and is compatible with other existing hotel, retail and restaurant uses in the area, some of which also sell alcohol.

G. The North Hotel with alcohol service will not be operated or maintained in a way detrimental to the public health, safety or welfare, or materially injurious to properties or improvements in the vicinity. As discussed in Finding No. 5.B above, the Project was conditioned to avoid impacts and the Project is required to meet ESMC and Building Code requirements regarding noise and safety.

SECTION 6: *Off-Site Parking Approval Findings (ESMC § 15-15-3(H)(3).).* After considering the factual findings of this Resolution, the Commission continues to find that off-site parking is appropriate for the North Hotel use based on the following:

A. The North Hotel is in close proximity of the off-site parking facilities. The existing off-site surface parking lot is within reasonable walking distance of the North Hotel. The south end of the surface parking lot is within 100 feet of the North Hotel lobby entrance. Additionally, after construction of the Fairfield Parking Structure, the North Hotel will meet its parking needs with 26 on-site parking spaces and the spaces provided in the Fairfield Parking Structure. Although the Fairfield Parking Structure will be located off-site as a result of the newly created lots from the recordation of the Vesting Map No. 82806, the Fairfield Parking Structure will have direct pedestrian access across the driveway from the hotel lobby entrance on the lot to the north.

B. The North Hotel has good pedestrian access to the existing off-site parking facilities. Pedestrians can easily access the off-site parking from the North Hotel on the Pacific Coast Highway sidewalk. The intersection of Pacific Coast Highway and Mariposa Avenue has a controlled crosswalk and the off-site parking area is located less than 100 feet from the north end of this crosswalk. The parking lot can be accessed from both Mariposa Avenue and Pacific Coast Highway. Additionally, after construction of the Fairfield Parking Structure, the North Hotel will meet its parking needs with 26 on-site parking spaces and the spaces provided in the Fairfield Parking Structure. Although the Fairfield Parking Structure will be located off-site as a result of the newly created lots from the recordation of the Vesting Map No. 82806, the Fairfield Parking Structure will have direct pedestrian access across the driveway from the hotel lobby entrance on the lot to the north.

C. There is no need for transportation to and from this off-site parking facilities because of the close proximity of the parking lot to the hotel. Additionally, after construction of the Fairfield Parking Structure, the North Hotel will meet its parking needs with 26 on-site parking spaces and the spaces provided in the Fairfield Parking Structure. Although the Fairfield Parking Structure will be located off-site as a result of the newly created lots from the recordation of the Vesting Map No. 82806, the Fairfield Parking Structure will have direct pedestrian access across the driveway from the hotel lobby entrance on the lot to the north.

D. Hotel parking is an appropriate use type for off-site parking. Hotel parking is typically low turnover with guests leaving cars parked overnight and leaving the site for extended periods with infrequent travel to and from the site.

SECTION 7: *Actions.*

A. Based on the information and findings set forth above, the Planning Commission hereby recommends that the City Council approve the

modification of Conditional Use Permit No. CUP 14-01 which authorized the service of alcohol at the North Hotel to also allow the continued operation of a 350-room hotel. The Planning Commission further recommends that the City Council approve the use of off-site parking for the North Hotel in accordance with a Shared Use Parking Agreement. The Planning Commission recommends that these approvals be made subject to the conditions set forth in Exhibit "A".

B. The Planning Commission recommends that the City Council rescind approval of Subdivision No. SUB 14-05, Lot Tie Covenant No. MISC 14-03, and Off-Site Parking Covenant No. MISC 14-06.

SECTION 8: *Reliance on Record*. Each and every one of the findings and determinations in this Resolution are based on the competent and substantial evidence, both oral and written, contained in the entire record relating to the project. The findings and determinations constitute the independent findings and determinations of the Planning Commission in all respects and are fully and completely supported by substantial evidence in the record as a whole. The absence of any particular fact from any such summary is not an indication that a particular finding is not based in part on that fact.

SECTION 9: *Limitations*. The Planning Commission's analysis and evaluation of the project is based on the best information currently available. It is inevitable that in evaluating a project that absolute and perfect knowledge of all possible aspects of the project will not exist. One of the major limitations on analysis of the project is the Planning Commission's lack of knowledge of future events. In all instances, best efforts have been made to form accurate assumptions.

SECTION 10: *Operative Date.* This Resolution shall take effect immediately upon its passage and adoption.

SECTION 11: The Commission Secretary is directed to mail a copy of this Resolution to BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC, and BRE El Segundo Parking LLC and to any other person requesting a copy.

SECTION 12: This Resolution may be appealed within ten (10) calendar days after its adoption. All appeals must be in writing and filed with the City Clerk within this time period. Failure to file a timely written appeal will constitute a waiver of any right of appeal.

PASSED, APPROVED AND ADOPTED this ___ day of February 2022.

PLANNING COMMISSION RESOLUTION NO. 2906

Exhibit A

CONDITIONS OF APPROVAL

In addition to all applicable provisions of the El Segundo Municipal Code ("ESMC"), BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC, and BRE El Segundo Parking LLC agrees to comply with the following provisions as conditions for the City of El Segundo's approval of modification of CUP No. 14-01 and approval of Off-Site Parking ("Project Conditions"):

Planning Division Conditions

1. Any subsequent modification to the North Hotel as approved, including the site plan and landscaping, must be referred to the Director of Development Services to determine if the proposed modification in compliance with the Pacific Coast Commons Specific Plan.

2. The final irrigation plans must comply with the following:

    a. Efficient irrigation systems must be installed which minimize runoff and evaporation and maximize the water which will reach plant roots (e.g., drip irrigation, automatic sprinklers equipped with moisture sensors).

    b. Automatic sprinkler systems must be set to irrigate landscaping during early morning hours or during the evening to reduce water losses from evaporation. Sprinklers must also be reset to water less often in cooler months and during the rainfall season so that water is not wasted by excessive landscaping irrigation.

3. A Shared Use Parking Agreement shall be prepared and reviewed and approved by the Director of Development Services and the City Attorney. The Shared Use Parking Agreement will grant Lots 1 through 5 of Vesting Map No. 82806 rights to shared use of parking provided on Lots 1, 4 and 5 of Vesting Map No. 82806. The shared parking will be permitted for all commercial uses, including hotel uses, and guest parking for the multi-family residential uses located on Lots 1 and 5 of Vesting Map No. 82806. Guest parking for the townhomes that are located on Lot 6 will be provided on Lot 5 of Vesting Map No. 82806.

    The Shared Use Parking Agreement will rescind "Covenant and Agreement Regarding Maintenance and Use of Off-Site Parking" for property commonly known as 629 North Sepulveda Boulevard (now known as 629 North Pacific Coast Highway), recorded on July 1, 2015, as Instrument No. 20150792117, of Official Records, Recorder's Office of the County of Los Angeles, California. The Shared Use Parking Agreement will rescind "Covenant and Agreement Regarding Maintenance of Parking Site" for property commonly known as 629 North Sepulveda Boulevard (now known as 629 North Pacific Coast Highway) recorded

on April 1, 2015, as Instrument No. 20150351986, of Official Records, Recorder's Office of the County of Los Angeles, California.

4. A Reciprocal Easement Agreement shall be prepared to provide reciprocal access between Lot 2 and 3 of Vesting Tentative Map No. 82806 and reciprocal access to the Indiana Street public right-of-way. The Reciprocal Easement Agreement shall be reviewed and approved by the Director of Development Services and the City Attorney. The Reciprocal Easement Agreement shall not be recorded until the final map for Vesting Tentative Map No. 82806 is recorded.

5. A Reciprocal Easement Agreement shall be prepared to provide reciprocal access between Lots 3 and 4 of Vesting Tentative Map No. 82806 and reciprocal access to the public rights-of-way of Pacific Coast Highway and Indiana Street. The Reciprocal Easement Agreement shall be reviewed and approved by the Director of Development Services and the City Attorney. The Reciprocal Easement Agreement shall not be recorded until the final map for Vesting Tentative Map No. 82806 is recorded.

6. The existing turnout area on Pacific Coast Highway must be designated as the loading zone for the North Hotel.

7. The applicant must maintain all licenses required by the Alcohol Beverage Control Act (Business & Professions Code §§ 23300, *et seq*.). The applicant must continue to maintain all applicable licenses at the site.

8. Hours of operations for alcohol service at the North Hotel is limited to the hours between 6 a.m. and 2 a.m. daily.

9. Taxicab phone numbers must be posted in a conspicuous location at all times in the area(s) where alcohol is served to customers.

10. The premises must be maintained in a litter and graffiti-free manner. Any graffiti that appears on the premises must be removed within 48 hours.

11. The applicant must comply with all regulations of the Alcoholic Beverage Control Act and the regulations promulgated by the Alcoholic Beverage Control Board including, without limitation, the regulations set forth in 4 Cal. Code of Regs. §§ 55, *et seq.*

12. The applicant must post a sign in a clear and conspicuous location listing a phone number at which a responsible party may be contacted during all open hours of the establishment to address any concerns of the community regarding noise at the North Hotel. Said contact's name and phone number must also be available through hotel staff at all times.

13. The applicant must, at all times, display a *Designated Driver* sign of at least ten inches by ten inches (10" X 10") in the service area of the "food and beverage"

building. The sign must be worded in a way that reminds patrons who are consuming alcohol to designate a *non*-drinking driver.

14. There shall not be exterior advertising of any kind or type, including advertising directed to the exterior from within, promoting or indicating the availability of alcoholic beverages. Interior displays of alcoholic beverages which are clearly visible to the exterior also violate this condition.

15. All employees serving alcoholic beverages to patrons must enroll in and complete a certified training program approved by the State Department of Alcoholic Beverages Control (ABC) for the responsible sales of alcohol. The training must be offered to new employees on not less than a quarterly basis.

16. Any and all employees hired to sell alcoholic beverages must provide evidence that they have either:

    a. Completed training from the State of California Department of Alcoholic Beverage Control (ABC), Long Beach/Lakewood District Office administered *Leadership and Education in Alcohol and Drugs* (LEAD) Program in the form of an ABC-issued certificate; or

    b. Completed an accepted equivalent by the ABC, Long Beach/Lakewood District Office to ensure proper distribution of beer, wine and distilled spirits to adults of legal age;

    c. If any prospective employee designated to sell alcoholic beverages does not currently have such training, then the ABC-licensed proprietors must have confirmed with the Development Services Department within fifteen (15) days of the Director's decision, or by final project approval, that a date certain has been scheduled within the local ABC Office to complete the LEAD course.

    d. Within thirty (30) days of taking said course, the employees, or responsible employer must deliver each required certificate showing completion to the Police Department.

Building Safety Division Conditions

17. The project is required to comply with storm water requirements per NPDES Permit No. CAS0040001 Order Number R4-2021-0105

Public Works Department Conditions

18. The applicant must provide a water service connection and water meter for each parcel.

19. The project must comply with ESMC Chapter 5-4 regarding MS4 permit requirements.

Police Department Conditions

20. Street addressing must be a minimum of 6 inches tall, visible from the street or driving surface, of contrasting color to the background and directly illuminated during hours of darkness.

21. A safe for use by the hotel operator must be installed in a secured location and must be anchored. The location and anchoring is subject to review and approval by the Police Chief, or designee.

22. A sign that identifies the location is private property and that no trespassing is allowed must be installed at the entrance of the pool.

23. A minimum security camera plan must be prepared for the hotel building. The number of cameras and the locations of cameras are subject to Police Chief, or designee, review and approval. Monitoring and recording equipment must be stored in a secured area.

24. Cameras recording driveways and driving surfaces must monitor and record vehicle occupants and vehicle license plate number as they enter/exit.

25. Any security cameras must meet the City's minimum camera specifications and requirements as determined by the Police Chief, or designee.

26. The location and number of exterior mounted ladders are subject to Police Chief, or designee's, review and approval.

Fire Department Conditions

27. The applicant must provide the following conditions for any fire features:

    a. A barrier must be provided around the fire feature to prevent accidental access into the fire feature.

    b. The distance between the fire feature and combustible material and furnishings must meet the fire feature's listing and manufacturer's requirements.

    c. If the fire feature's protective barrier exceeds ambient temperatures, all exit paths and occupant seating must be a minimum 36 inches from the fire feature.

28. The applicant must provide for a central control station for Fire Department operations in the North Hotel. The rooms must comply with California Fire Code 915.4, as adopted by the ESMC.

Miscellaneous Conditions

29. BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC agrees to indemnify and hold the City harmless from and against any claim, action, damages, costs (including, without limitation, attorney's fees), injuries, or liability, arising from the City's approval of modification of Conditional Use Permit No. CUP 14-01 and re-approval of Off-Site Parking. Should the City be named in any suit, or should any claim be brought against it by suit or otherwise, whether the same be groundless or not, arising out of the City approval of modification of Conditional Use Permit No. CUP 14-01 and re-approval of Off-Site Parking, the Applicant agrees to defend the City (at the City's request and with counsel satisfactory to the City) and will indemnify the City for any judgment rendered against it or any sums paid out in settlement or otherwise. For purposes of this section "the City" includes the City of El Segundo's elected officials, appointed officials, officers, and employees.

30. The Planning Commission is authorized to hear and act upon future applications for amendments to Conditional Use Permit 14-01 and the off-site parking approval.

31. The release of Lot-Tie Covenant MISC No. 14-03 for the parking lot at 629 North Pacific Coast Highway may not be recorded until Vesting Tentative Map No. 82806 is recorded.

By signing this document, Patrick Volz, Vice President, BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC, certifies that he has read, understood, and agree to the Project Conditions listed in this document.

RESOLUTION NO. 2907

A RESOLUTION RECOMMENDING THAT THE CITY COUNCIL AMEND CONDITIONAL USE PERMIT NO. 14-02 TO ALLOW THE CONTINUED OPERATION OF AN EXISTING 246-ROOM HOTEL IN ADDITION TO THE PREVIOUSLY APPROVED ALCOHOL SERVICE AT 475 NORTH PACIFIC COAST HIGHWAY AND APPROVE OFF-SITE PARKING FOR THE SOUTH HOTEL SITE

(PROJECT NO. EA-1248; AMENDMENT OF CONDITIONAL USE PERMIT CUP NO. 14-02; AND OFF-SITE PARKING).

(SOUTH HOTEL)

The Planning Commission of the City of El Segundo does resolve as follows:

SECTION 1: The Commission finds and declares that:

A. On October 9, 2014 the Planning Commission approved Resolution No. 2760 approving an application to modify the then 619-room Hacienda Hotel into two hotels, a 350-room north hotel site (the "North Hotel") and a 246-room south hotel site ("the South Hotel"). Along with approving this modification, Resolution No. 2760 approved a conditional use permit to allow operation of a bar serving alcohol and alcohol service in meeting spaces, the patio, and pool area in the South Hotel (CUP No. 14-02), a tentative map to reconfigure the existing lots into two separate parcels for the North Hotel and South Hotel (SUB No. 14-05), an off-site parking covenant to permit 23 off-site parking spaces for the South Hotel in surface parking lot located north of Mariposa Avenue (Off-Site Parking Covenant No. MISC 14-02) and a lot-tie covenant holding the existing three parcels underlying the existing off-site parking lot as one property for parking purposes (Lot Tie Covenant No. MISC 14-03). The property owner never recorded the map.

B. Subsequent to the approvals listed above, the property was sold on May 13, 2019. BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC (collectively "BRE") filed several applications to develop the hotel properties with a mixed-use development known as the Pacific Coast Commons Specific Plan. Under the proposed Specific Plan hotels will be allowed as a conditionally permitted use. BRE's application includes a request to amend the existing Conditional Use Permit (CUP No. 14-02) for the South Hotel Site (Aloft Hotel) located at 475 Pacific Coast Highway (the "Project Site") to allow the continued use of the hotel, the continued alcohol service in the existing bar/lounge area, conference room and multi-purpose rooms, and pool deck and outdoor patio and the modification of the off-site parking.

C. As part of the Pacific Coast Commons Specific Plan, the City Council will consider Vesting Tentative Map. No. 82806 that will combine the 12 existing

parcels comprising the hotel properties into 4 parcels and create two parcels at the north parking lot site that is currently comprised of 3 parcels held together by a lot-tie covenant. Additionally, the Council will consider a Shared Parking Agreement in conjunction with a Parking Demand Study and Shared Parking Analysis to establish the parking requirements among the various uses.

D. The Pacific Coast Commons Specific Plan Project (the "Project") includes the discretionary actions contemplated herein and all of the discretionary actions required for the Project are collectively identified as Environmental Assessment No. EA-1248.

E. The Project has been reviewed by the City's Development Services Department for, in part, consistency with the General Plan and conformity with the El Segundo Municipal Code ("ESMC");

F. In addition, the City reviewed the Project's potential environmental impacts under the California Environmental Quality Act (Public Resources Code §§ 21000, *et seq.*, "CEQA"), the regulations promulgated thereunder (14 Cal. Code of Regulations §§15000, *et seq.*, the "CEQA Guidelines");

G. The Development Services Department completed its review and scheduled a public hearing regarding the application before this Commission for November 18, 2021; along with consideration of all the approvals required for the Pacific Coast Commons Specific Plan project including Environmental Assessment No. EA-1248;

H. On November 18, 2021, the Commission held a noticed public hearing to receive public testimony and other evidence regarding the application including, without limitation, information provided by BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC and its representatives;

I. On November 18, 2021, the Planning Commission continued the public hearing to December 9, 2021;

J. On December 8, 2021 a letter was submitted to the City by Mitchell M. Tsai, Attorney At Law, on behalf of the Southwest Regional Council of Carpenters ("Carpenters' Letter") objecting to the Project and referring to an earlier letter which had never been received by the City which raised issues with the EIR; and

K. Based on the submission of the Carpenters' Letter the City determined that it would be necessary to continue the hearing to allow time to respond, but nevertheless took testimony on December 9, 2021; and

L. During the public testimony portion of the hearing, a letter was submitted by the Lozeau Drury law firm on behalf of Supporters Alliance For Environmental Responsibility ("SAFER letter");

M. On February 10, 2022, the Planning Commission held a new duly noticed public hearing to receive public testimony and other evidence regarding the application;

N. The Commission considered the information provided by City staff, public testimony, and the representatives for the applicant; and

O. This Resolution, and its findings are made based upon the entire administrative record including, without limitation, testimony and evidence presented to the Commission at its November 18, 2021, December 9, 2021, and February 10, 2022 public hearings including, without limitation, the staff reports submitted by the Development Services Department.

SECTION 2: *Factual Findings and Conclusions*. The Planning Commission finds that the following facts exist:

A. The existing nine-story, 246-room hotel will be located in the Pacific Coast Commons Specific Plan (PCCSP) Zone upon adoption of the Pacific Coast Commons Specific Plan.

B. The South Hotel site consists of six legal lots. The hotel site is located on the west side of Pacific Coast Highway and includes the southern half of the block between East Mariposa Avenue to the north, East Holly Avenue to the south and Indiana Street to the east. The South Hotel site will consist of one lot (Lot 2) after the recordation of Vesting Tentative Map No. 82806. The total lot area will be 39,425 square feet.

C. The South Hotel utilizes two parking areas. The existing off-street parking area located immediately to the south of the hotel lobby entrance is fully developed with a surface parking lot containing 175 parking stalls and three driveway access points from Pacific Coast Highway, Holly Avenue and Indiana Street. The parking area will become Lot 1 of Vesting Tentative Map No. 82806. Parking for the South Hotel also includes the use of 23 parking spaces through a parking covenant on a lot located on the west side of Pacific Coast Highway in the block between East Mariposa Avenue to the south and East Palm Avenue to the north comprised of 236 parking spaces. This off-site parking lot will become Lot 5 of Vesting Tentative Map No. 82806. When the Pacific Coast Commons project is built out there will be parking structures on Lots 1, 4 and 5 which will accommodate parking for the South Hotel, the North Hotel, other commercial uses and the multiple-family residential development. A Shared Use Parking Agreement will be recorded to share parking for any overflow needs for the hotel, other commercial uses, and multiple-family residential guest parking within the Pacific Coast Commons Specific Plan.

D. The South Hotel includes an existing bar with alcohol service. The applicant sells a full-line of alcoholic beverages for consumption in the following locations in the South Hotel: bar and lounge area of the south hotel lobby; outdoor patio and pool deck area; three pool adjacent hotel suites; ground-floor multipurpose rooms and two meeting rooms on the second floor. Conditional Use Permit No. 14-02 for alcohol service runs with the land and will continue to allow sales between the hours of 6 a.m. and 2 a.m. daily. The applicant has a California Department of Alcoholic Beverage Control for a Type 47 license (on-site beer, wine and distilled spirits).

E. The Project includes a request to amend the existing South Hotel conditional use permit (CUP No. 14-02) to be applicable to the South Hotel and its existing associated alcohol uses in order to be consistent with the conditionally permitted uses allowed with the adoption of the Pacific Coast Commons Specific Plan (PCCSP).

SECTION 3: *Environmental Assessment*. The modifications set forth in this Resolution were part of the overall Pacific Coast Commons Project analyzed as part of EA-1248. An environmental impact report was prepared for the project and, by separate resolution (Resolution No. 2905), the Planning Commission has recommended that the City Council certify the Final Environmental Impact Report. The findings and recommendation set forth in Resolution No. 2905 are incorporated herein by reference.

SECTION 4: *General Plan Findings*. The changes approved by this resolution will further the goals, policies, and objectives of the General Plan and will not obstruct their attainment. Specifically:

A. The hotel use and alcohol use are existing uses and are conditionally permitted in the Pacific Coast Commons Specific Plan.

B. The hotel use is consistent with Economic Development Element Policy ED 1-2.2 to “maintain and promote land uses that improve the City’s tax base, balancing economic development and quality of life goals.” The existing renovated hotel facility has resulted in a site that improves the City’s tax base because the hotel is a more attractive destination to visitors, which has improved occupancy and room rates. The South Hotel contributes to the City’s quality of life as it improves the appearance of existing hotel buildings located on Pacific Coast Highway, the City’s major commercial corridor.

C. The South Hotel is consistent with Circulation Element Policy C2-2.2 to “encourage new development to provide facilities for bicyclists to park and store their bicycles and provide shower and clothes changing facilities at or close to the bicyclist’s work destination.” The South Hotel includes existing bicycle parking.

D. The South Hotel is consistent with Circulation Element Objective C3-2 to “ensure the consideration of the impacts of land use decisions on the City’s parking situation.” The project will provide parking in compliance with the

parking requirements established in the Pacific Coast Commons Specific Plan and the Parking Demand Study and Shared Use Analysis for the hotel and other planned uses through a combination of off-site parking provided immediately to the south of the hotel lobby entrance with an additional off-site parking spaces at the existing hotel surface parking lot north of Mariposa Avenue. The parking at the surface parking lot north of Mariposa is provided through an off-site parking covenant. A Shared Use Parking Agreement will replace the off-site parking covenant after the recordation of Vesting Tentative Map No. 82806.

E. Noise Element Objective N1-2 to ensure that City residents are not exposed to stationary noise levels in excess of El Segundo's Noise Ordinance standards." The South Hotel is required to operate in compliance with the City's noise ordinance.

SECTION 5: *Conditional Use Permit Amendment Findings.* Pursuant to ESMC § 15-23-6, the Planning Commission finds that amending CUP No. 14-02 to allow for the continued use of the South Hotel with alcohol service is appropriate based on the following:

A. The South Hotel with alcohol service meets the objectives of ESMC Title 15 and the purposes of the zone in which the site is located. The PCC COM-1 Land Use District in the Pacific Coast Commons Specific Plan (PCCSP) Zone allows for a hotel as a conditionally permitted use. A bar serving alcohol is a typical accessory use in a hotel and is also allowed in the PCC COM-1 Land Use District pursuant to a conditional use permit. The hotel including the bar are existing uses. The 25-foot long bar in the lobby area of the South Hotel is a typical amenity for the class of hotel. The alcohol service area of the bar/lobby lounge, conference and multi-purpose rooms, pool deck and patio areas and three guest rooms is appropriate for a hotel use. Therefore, the proposed location meets the objectives of the Pacific Coast Commons Specific Plan (PCCSP) Zone and Title 15.

B. The South Hotel and the continued service of alcohol will not be detrimental to the public health, safety or welfare, or materially injurious to properties or improvements in the vicinity. The alcohol serving bar use was reviewed by the City's Police and Fire Departments. Both Departments recommended conditions of approval incorporated into this Resolution. The bar must be operated in a manner consistent with the conditions of approval as well as with ESMC noise and nuisance standards. The alcohol service proposed for the South Hotel will be the same as existing operating conditions. Compliance with project conditions of approval, ABC requirements and ESMC noise and nuisance requirements will result in a conditional use not detrimental to public health, safety and welfare.

C. The South Hotel and the continued service of alcohol will comply with each of the applicable provisions of ESMC Chapter 15-23. The bar serving alcohol in the South Hotel is compatible with the hotel use at the site. The existing hotel has been in operation approximately 64 years and has had alcohol service

over this time. The South Hotel indoor bar/lounge areas as well as alcohol service in conference room and multi-purpose rooms will be screened from view and have no visual or noise impacts on other uses, including residential uses, in the general vicinity. Outdoor alcohol service around the pool deck and patio are screened from nearby residential and commercial neighbors by on-site structures and walls. Any noise generated in the outdoor alcohol service areas are subject to ESMC Chapter 7-2 "Noise and Vibration" requirements. Failure to comply with ESMC noise requirements could result in the Director imposing additional restrictions on outdoor alcohol service, such as limitations on hours of outdoor alcohol service and where outdoors alcohol may be served. Continued non-compliance with ESMC noise and nuisance requirements could result in revocation of the conditional use. Impacts such as smoke, dust, or fumes are not associated with the requested conditional use. Furthermore, the use will generate traffic generally consistent with the existing operation of the site, as the site currently is developed as a hotel with alcohol service.

D. The South Hotel must comply with State of California Department of Alcohol Beverage Control licensing requirements; the South Hotel has a Type 47 ABC license before operating alcohol service at the hotel.

E. The South Hotel with alcohol service is compatible with the particular use of the site and with other existing and potential uses in the general area. The long-established hotel use at the site is compatible with alcohol service. The hotel with alcohol service has been operating at the site for approximately 64 years and a hotel is a compatible use for a major commercial thoroughfare. The alcohol service operations at the South Hotel is different from current hotel operations at the site. Indoor alcohol service will have no impact or adjacent residential properties. Outdoor alcohol service will be screened from adjacent residential properties.

F. The use is consistent and compatible with the purpose of the PCCSP Zone in that this zone allows for a range of commercial uses such as office, hotels, restaurants, retail, and on-site and off-site alcohol sales. A bar serving alcohol is consistent with the purpose of this commercial zone and is compatible with other existing hotel, retail and restaurant uses in the area, some of which also sell alcohol.

G. The South Hotel with alcohol service will not be operated or maintained in a way detrimental to the public health, safety or welfare, or materially injurious to properties or improvements in the vicinity. As discussed in Finding No. 5.B above, the Project was reviewed by the City's Police and Fire Departments, the Project was conditioned to avoid impacts and the Project is required to meet ESMC and Building Code requirements regarding noise and safety.

SECTION 6: *Off-Site Parking Approval Findings (ESMC § 15-15-3(H)(4).).* After considering the factual findings of this Resolution, the Commission continues to find that off-site parking is appropriate for the South Hotel use based on the following:

A. The South Hotel is in close proximity to the current off-site parking facilities. The off-site surface parking lot is within reasonable walking distance of the South Hotel site. The south end of the surface parking lot is within 700 feet from the South Hotel lobby entrance. Vehicle access to the off-site parking from the South Hotel site can occur by travelling northbound on either Illinois Street or Indiana Street.

B. The Project has good pedestrian access to the off-site parking facilities. Pedestrians can easily access the off-site parking from the South Hotel on the Illinois Street or Pacific Coast Highway sidewalk. The intersection of Pacific Coast Highway and Mariposa Avenue has a controlled crosswalk and the off-site parking area is located less than 100 feet from the north end of this crosswalk. The parking lot can be accessed from both Mariposa Avenue and Pacific Coast Highway.

C. There is no need for transportation to and from this off-site parking facilities because of the close proximity of the parking lot to the hotel. After construction of the PCC South Site residential and commercial mixed-use development, the off-site parking will be primarily located in the new parking structure on the lot immediately adjacent to the hotel (PCC South Site/Lot 1 of Vesting Map No. 82806). The entrance to the parking structure will be immediately adjacent to the south of the hotel lobby. Additionally, overflow parking will be accommodated in the existing off-site parking located in the new Fairfield Parking structure and the current off-site parking location north of the Fairfield Hotel (currently a paved parking lot which will be replaced with a residential and commercial mixed-use development and new parking structure).

D. Hotel parking is an appropriate use type for off-site parking. Hotel parking is typically low turnover with guests leaving cars parked overnight and leaving the site for extended periods with infrequent travel to and from the site.

SECTION 7: *Action.* Based on the information and findings set forth above, the Planning Commission hereby recommends that the City Council approve the modification of Conditional Use Permit No. CUP 14-02 which authorized the service of alcohol at the South Hotel to also allow the continued operation of a 246-room hotel. The Planning Commission further recommends that the City Council approve the use of off-site parking for the South Hotel in accordance with a Shared Use Parking Agreement. The Planning Commission recommends that these approvals be made subject to the conditions set forth in Exhibit "A".

SECTION 8: *Reliance on Record*. Each and every one of the findings and determinations in this Resolution are based on the competent and substantial evidence, both oral and written, contained in the entire record relating to the project. The findings and determinations constitute the independent findings and determinations of the Planning Commission in all respects and are fully and completely supported by substantial evidence in the record as a whole. The absence of any particular fact from any such summary is not an indication that a particular finding is not based in part on that fact.

SECTION 9: *Limitations*. The Planning Commission's analysis and evaluation of the project is based on the best information currently available. It is inevitable that in evaluating a project that absolute and perfect knowledge of all possible aspects of the project will not exist. One of the major limitations on analysis of the project is the Planning Commission's lack of knowledge of future events. In all instances, best efforts have been made to form accurate assumptions.

SECTION 10: *Operative Date.* This Resolution shall take effect immediately upon its passage and adoption.

SECTION 11: The Commission Secretary is directed to mail a copy of this Resolution to BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC, and BRE El Segundo Parking LLC and to any other person requesting a copy.

SECTION 12: This Resolution may be appealed within ten (10) calendar days after its adoption. All appeals must be in writing and filed with the City Clerk within this time period. Failure to file a timely written appeal will constitute a waiver of any right of appeal.

PASSED, APPROVED AND ADOPTED this ____ day of February 2022.

PLANNING COMMISSION RESOLUTION NO. 2907

Exhibit A

CONDITIONS OF APPROVAL

In addition to all applicable provisions of the El Segundo Municipal Code ("ESMC"), BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC agrees to comply with the following provisions as conditions for the City of El Segundo's approval of an amendment to CUP No. 14-02 and of the approval of Off-Site Parking, ("Project Conditions"):

Planning Division Conditions

1. Any subsequent modification to the South Hotel as approved, including the site plan and landscaping, must be referred to the Director of Development Services to determine if the proposed modification is in compliance with the Pacific Coast Commons Specific Plan.

2. The final irrigation plans must comply with the following:

    a. Efficient irrigation systems must be installed which minimize runoff and evaporation and maximize the water which will reach plant roots (e.g., drip irrigation, automatic sprinklers equipped with moisture sensors).

    b. Automatic sprinkler systems must be set to irrigate landscaping during early morning hours or during the evening to reduce water losses from evaporation. Sprinklers must also be reset to water less often in cooler months and during the rainfall season so that water is not wasted by excessive landscaping irrigation.

3. A Shared Use Parking Agreement shall be prepared and reviewed and approved by the Director of Development Services and the City Attorney. The Shared Use Parking Agreement will grant Lots 1 through 5 of Vesting Map No. 82806 rights to shared use of parking provided on Lots 1, 4 and 5 of Vesting Map No. 82806. The shared parking will be permitted for all commercial uses, including hotel uses, and the guest parking for the multi-family residential uses that is located on Lot 1 and Lot 5 of Vesting Map No. 82806. Guest parking for the townhomes that are located on Lot 6 will be provided on Lot 5 of Vesting Map No. 82806.

    The Shared Use Parking Agreement will rescind "Covenant and Agreement Regarding Maintenance and Use of Off-Site Parking" for property commonly known as 629 North Sepulveda Boulevard (now known as 629 North Pacific Coast Highway), recorded on July 1, 2015, as Instrument No. 20150792117, of Official Records, Recorder's Office of the County of Los Angeles, California. The Shared Use Parking Agreement will rescind "Covenant and Agreement Regarding

Maintenance of Parking Site" for property commonly known as 629 North Sepulveda Boulevard (now known as 629 North Pacific Coast Highway) recorded on April 1, 2015, as Instrument No. 20150351986, of Official Records, Recorder's Office of the County of Los Angeles, California.

4. A Reciprocal Easement Agreement shall be prepared to provide reciprocal access between Lots 1 and 2 of Vesting Tract Map No. 82806 and reciprocal access to the public rights-of-way of Pacific Coast Highway and Indiana Street. The Reciprocal Easement Agreement shall be reviewed and approved by the Director of Development Services and the City Attorney. The Reciprocal Easement Agreement shall not be recorded until the final map for Vesting Map No. 82806 is recorded.

5. A Reciprocal Easement Agreement shall be prepared to provide reciprocal access between Lot 2 and 3 of Vesting Map No. 82806 and reciprocal access to the Indiana Street public right-of-way. The Reciprocal Easement Agreement shall be reviewed and approved by the Director of Development Services and the City Attorney. The Reciprocal Easement Agreement shall not be recorded until the final map for Vesting Map No. 82806 is recorded.

6. The Director of Development Services, or designee, can impose additional restrictions regarding the South Hotel building façade accent lighting if this lighting is found to have adverse impacts on adjacent residential neighbors. Additional restrictions may include, but are not limited to, time restrictions on when the lighting can be turned on and/or a reduction in the intensity of the lighting.

7. The applicant must obtain and maintain all licenses required by the Alcohol Beverage Control Act (Business & Professions Code §§ 23300, *et seq*.). The applicant must obtain and maintain a Type 47 license.

8. Hours of operations for alcohol service at the South Hotel is limited to the hours between 6 a.m. and 2 a.m. daily.

9. Locations where alcohol service is permitted outdoors, must comply with ESMC §§ 7-2-1, *et seq.,* regulating noise and vibration.

10. Taxicab phone numbers must be posted in a conspicuous location at all times in the area(s) where alcohol is served to customers.

11. The premises must be maintained in a litter and graffiti-free manner. Any graffiti that appears on the premises must be removed within 48 hours.

12. The applicant must comply with all regulations of the Alcoholic Beverage Control Act and the regulations promulgated by the Alcoholic Beverage Control Board including, without limitation, the regulations set forth in 4 Cal. Code of Regs. §§ 55, *et seq.*

13. The applicant must post a sign in a clear and conspicuous location listing a phone number at which a responsible party may be contacted during all open hours of the establishment to address any concerns of the community regarding noise at the

South Hotel. Said contact's name and phone number must also be available through hotel staff at all times.

14. The applicant must, at all times, display a *Designated Driver* sign of at least ten inches by ten inches (10" X 10") in the bar at eye level. The sign must be worded in a way that reminds patrons who are consuming alcohol to designate a *non*-drinking driver.

15. There shall not be exterior advertising of any kind or type, including advertising directed to the exterior from within, promoting or indicating the availability of alcoholic beverages. Interior displays of alcoholic beverages which are clearly visible to the exterior also violate this condition.

16. All employees serving alcoholic beverages to patrons must enroll in and complete a certified training program approved by the State Department of Alcoholic Beverages Control (ABC) for the responsible sales of alcohol. The training must be offered to new employees on not less than a quarterly basis.

17. Any and all employees hired to sell alcoholic beverages must provide evidence that they have either:

    a. Completed training from the State of California Department of Alcoholic Beverage Control (ABC), Long Beach/Lakewood District Office administered *Leadership and Education in Alcohol and Drugs* (LEAD) Program in the form of an ABC-issued certificate; or

    b. Completed an accepted equivalent by the ABC, Long Beach/Lakewood District Office to ensure proper distribution of beer, wine and distilled spirits to adults of legal age;

    c. If any prospective employee designated to sell alcoholic beverages does not currently have such training, then the ABC-licensed proprietors must have confirmed with the Development Services Department within fifteen (15) days of the Director's decision, or by final project approval, that a date certain has been scheduled within the local ABC Office to complete the LEAD course.

    d. Within thirty (30) days of taking said course, the employees, or responsible employer must deliver each required certificate showing completion to the Police Department.

18. If complaints are received regarding excessive noise, lighting, building access, or other disturbances associated with alcohol service or the operations of the South Hotel, the Director of Development Services, or Police Chief, may take action to review the Conditional Use Permit, including without limitation, adding conditions or revoking the permit pursuant to ESMC Title 7 (Nuisances and Offenses) and ESMC §15-23-12.

Building Safety Division Conditions

19. The project is required to comply with storm water requirements per NPDES Permit No. CAS0040001 Order Number R4-2021-0105.

Public Works Department Conditions

20. The applicant must provide a water service connection and water meter for each parcel.

21. The project must comply with ESMC Chapter 5-4 regarding MS4 permit requirements.

Police Department Conditions

22. Street addressing must be a minimum of 6 inches tall, visible from the street or driving surface, of contrasting color to the background and directly illuminated during hours of darkness.

23. A safe for use by the hotel operator must be installed in a secured location and must be anchored. The location and anchoring is subject to review and approval by the Police Chief, or designee.

24. A sign that identifies the location is private property and that no trespassing is allowed must be installed at the entrance of the pool.

25. A minimum security camera plan must be prepared for the hotel building. The number of cameras and the locations of cameras are subject to Police Chief, or designee, review and approval. Monitoring and recording equipment must be stored in a secured area.

26. Cameras recording driveways and driving surfaces must monitor and record vehicle occupants and vehicle license plate number as they enter/exit.

27. Any security cameras must meet the City's minimum camera specifications and requirements as determined by the Police Chief, or designee.

28. The location and number of exterior mounted ladders are subject to Police Chief, or designee's review and approval.

Fire Department Conditions

29. The applicant must provide the following conditions for any fire features:

    a. A barrier must be provided around the fire feature to prevent accidental access into the fire feature.

    b. The distance between the fire feature and combustible material and

furnishings must meet the fire feature's listing and manufacturer's requirements.

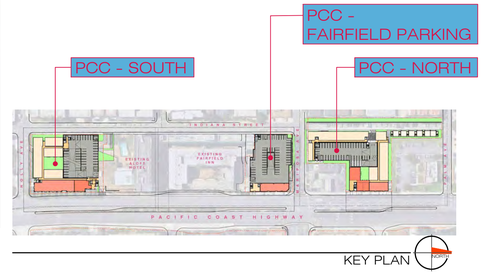
c. If the fire feature's protective barrier exceeds ambient temperatures, all exit paths and occupant seating must be a minimum 36 inches from the fire feature.

30. The applicant must provide for a central control station for Fire Department operations in the South Hotel. The rooms must comply with California Fire Code 915.4, as adopted by the ESMC.

Miscellaneous Conditions

31. BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC agrees to indemnify and hold the City harmless from and against any claim, action, damages, costs (including, without limitation, attorney's fees), injuries, or liability, arising from the City's approval of modification of Conditional Use Permit No. CUP 14-02 and re-approval of Off-Site Parking. Should the City be named in any suit, or should any claim be brought against it by suit or otherwise, whether the same be groundless or not, arising out of the City approval of modification of Conditional Use Permit No. CUP 14-02 and re-approval of Off-Site Parking, the Applicant agrees to defend the City (at the City's request and with counsel satisfactory to the City) and will indemnify the City for any judgment rendered against it or any sums paid out in settlement or otherwise. For purposes of this section "the City" includes the City of El Segundo's elected officials, appointed officials, officers, and employees.

32. The Planning Commission is authorized to hear and act upon future applications for amendments to Conditional Use Permit No. 14-02 and the off-site parking approval.



By signing this document, Patrick Volz, Vice President, BRE El Segundo Property Owner A LLC, BRE El Segundo Property Owner B LLC and BRE El Segundo Parking LLC, certifies that he has read, understood, and agree to the Project Conditions listed in this document.

4 PLANT PALETTE

STREET TREES

CONCEPT PLANT PALETTE

Street or parkway trees to be selected from El Segundo's Parkway Tree Palette or otherwise approved by El Segundo Recreation & Parks plan check engineer.

CERCIS CANADENSIS
'FOREST PANSY'
Forest Pansy Redbud

ARBUTUS MARINA
Strawberry Tree

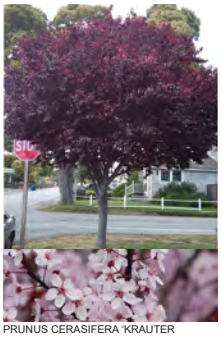
GEIJERA PARVIFOLIA
Australian Willow

KOELREUTERIA BIPINATA
Chinese Flame Tree

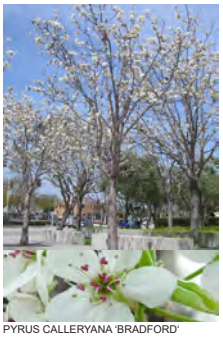
LAGERSTROEMIA INDICA
'NATCHEZ'
Natchez Crape Myrtle

PISTACHIA CHINENSIS
Chinese Pistache

TRISTANIA CONFERTA
Brisbane Box

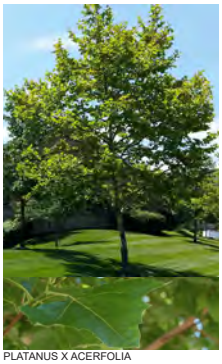


4 PLANT PALETTE



TREES

CONCEPT PLANT PALETTE



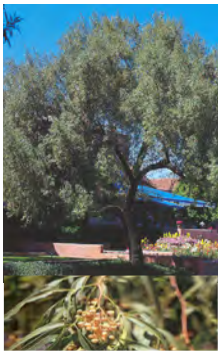
Designers may choose plants that are not on this list but have matching characteristics to maintain the look and feel of this concept palette. Selecting regionally appropriate plants and the consideration of climate and microclimate adaptability is the responsibility of the designer.

GEIJERA PARVIFOLIA
australian willow

PRUNUS CERASIFERA 'KRAUTER VESUVIUS'
krauter vesuvius purple leaf plum

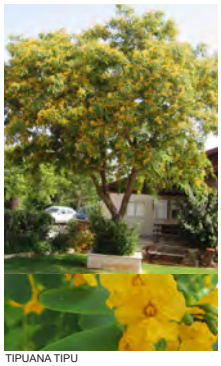
PYRUS CALLERYANA 'BRADFORD'
bradford pear

OLEA EUROPAEA 'SWAN HILL'
fruitless olive



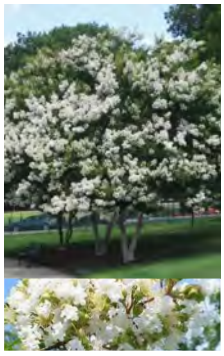
PLATANUS X ACERFOLIA
london plane tree

CERCIDIUM X 'DESERT MUSEUM'
desert museum



KOELREUTERIA BIPINATA
chinese flame tree

KOELREUTERIA PANICULATA
goldenrain tree

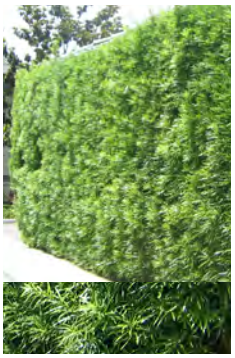


ARBUTUS MARINA
strawberry tree

RHUS LANCEA
african sumac

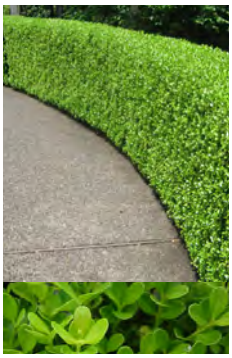
ULMUS PARVIFOLIA 'DRAKE'
chinese elm

TIPUANA TIPU
tipu tree



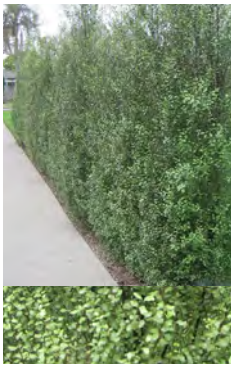
PODOCARPUS GRACILIOR
fern pine

LAGERSTROEMIA INDICA 'NATCHEZ'
natchez crape myrtle



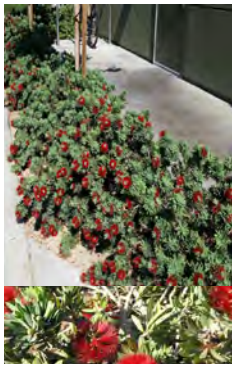
4 PLANT PALETTE

HEDGES AND SHRUBS



PITTOSPORUM CRASSIFOLIUM
karo

PODOCARPUS GRACILIOR
fern pine



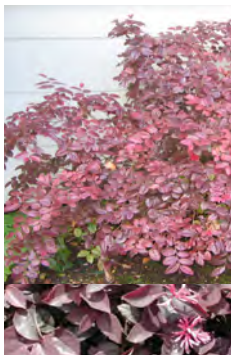
LIGUSTRUM JAPONICUM 'TEXANUM'
texas privet

BUXUS MICROPHYLLA JAPONICA
japanese boxwood

FICUS NITIDA
indian laurel fig

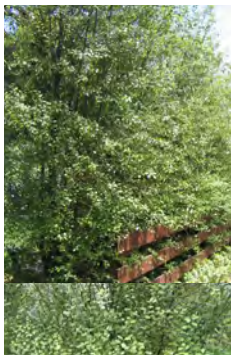
PITTOSPORUM TENUIFOLIUM 'SILVER SHEEN'
silver sheen kohuhu

DIANELLA CAERULEA 'CASSA BLUE'
blue flax lily

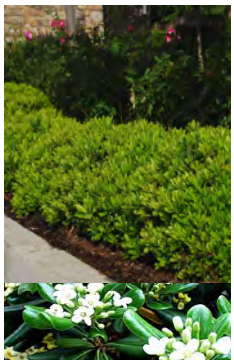


CALLISTEMON 'LITTLE JOHN'
little john bottlebrush

AGAVE ATTENUATA
foxtail agave



ALOE ARBORESCENS
torch aloe



KALANCHOE THRYSIFLORA
paddle plant

LIRIOPE GIGANTEA
big blue lilly turf

LOROPETALUM CHINESE 'RAZZLEBERRI'
razzleberri fringe flower

MYOPORUM PACIFICUM
myoporum

PITTOSPORUM 'SILVER SHEEN'
kohuhu 'Silver Sheen'

PITTOSPORUM TOBIRA 'WHEELER'S DWARF'
wheeler's dwarf tobira

AGAVE AMERICANA
century plant

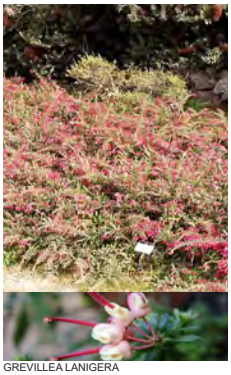
AGAVE 'BLUE FLAME'
blue flame agave

DIETES BICOLOR
fortnight lily

ROSA 'ICEBERG'
iceberg rose

4 PLANT PALETTE

SHRUBS AND VINES



FURCREA FOETIDA 'MEDIOPICTA'
furcrea

ROSMARINUS OFFICINALIS 'PROSTRATUS'
trailing rosemary

WESTRINGIA FRUTICOSA 'MORNING LIGHT'
coast rosemary

Subject: Development Feasibility Analysis – Pacific Coast Commons

Pursuant to your request, Keyser Marston Associates, Inc. (KMA) prepared an analysis of the development feasibility of the proposed Pacific Coast Commons Project (Project). KMA also reviewed the fiscal analysis prepared for the Project. The Project will be developed by Mar Ventures and Continental Development (Developer).

The Project is located on the west side of Pacific Coast Highway (PCH) between Holly Avenue and Palm Avenue in the City of El Segundo (City). The properties are currently developed with hotels, commercial buildings and surface parking lots. The proposed development will replace the surface parking lots and some of the obsolete commercial space with residential buildings that include some commercial space and structured parking.

PROJECT DESCRIPTION

The project is logically divided into two parts: the south site (PCC South) located at PCH and Holly Avenue; and the north site (PCC North & Fairfield) which covers the primarily residential project at PCH and Palm Avenue and the proposed parking structure at PCH and Mariposa Avenue. The properties include two existing hotels (Aloft and Fairfield Inn & Suites), which are not part of this analysis.

The PCC South component occupies approximately 1.24 acres. Developer proposes to build 120 rental residential units, 5,756 square feet of commercial space and 336 parking spaces in a parking structure, including spaces for the Aloft Hotel. The residential/commercial building is proposed to be six stories tall. The PCC North & Fairfield project covers approximately 2.53 acres. The project includes 137 rental residential units, six for sale townhouse units, 5,496 square feet of commercial space and 456 parking spaces in a parking structure, a portion of which is below grade. Some of the parking spaces are replacement parking spaces for the Fairfield Inn & Suites hotel.

The overall Project consists of 263 residential units, 11,252 square feet of commercial space and parking structures containing 792 parking spaces. The Developer has proposed to set aside 10% of the units (26 units) as affordable units. The Developer and the City are still in discussions as to whether these will be labeled as "State" moderate income units or "Federal" low-income units. In terms of the rents charged to tenants, there is little difference between the two designations. KMA has evaluated the Project as both an all-market rate project and as a project with 10% affordable units, assuming the Federal low-income rates.

FEASIBILITY ANALYSIS

In preparing this analysis, KMA has met with the City and the Developer. The Developer provided:

- Conceptual site plans and renderings
- Conceptual development costs and rents
- Conceptual pro forma
- Project market and fiscal reports

Independently, KMA reviewed project costs for a number of residential and mixed-use projects in Southern California and reviewed market rents and prices and unit sizes for apartment units and townhome units in the El Segundo market area.

For the feasibility analysis KMA evaluated the two components separately, as they could be independently developed. The market rate evaluation of PCC South is provided in Attachment 1 and the market rate evaluation of PCC North & Fairfield in Attachment 2.

The analysis conducted herein relies on the submittal from the Developer and our experience with other mixed-use developments in Southern California. The KMA analysis is presented in constant 2021 dollars. The KMA pro forma analysis is organized as follows:

- Table 1 - Estimated Development Cost
- Table 2 - Estimated Net Operating Income/Sales Revenue
- Table 3 - Estimated Project Surplus/(Feasibility Gap)

In the feasibility analysis, KMA first evaluated the projects as all-market rate projects to understand whether the overall project was feasible. KMA then evaluated the project assuming that 10% of the units were set aside for low-income tenants.[1] This evaluation was conducted to see if the project was still feasible and to indicate the "value lost" by including the affordable units.

Estimated Development Costs

The estimated development costs are shown in Table 1 of each attachment. After reviewing the conceptual development costs provided by the Developer, KMA prepared its pro forma based upon projected development costs for a number of residential projects currently in planning or development. The projects ranged from all-market rate projects to 100% affordable projects. Most projects include a limited amount of commercial space.

In general, the projects are similar in construction type – multi story buildings with structured or subterranean parking. There are differences in unit mix with a number of the projects being family projects (primarily two and three bedroom). The family projects were nearly all 100% affordable projects and are subject to prevailing wage requirements.

The site is currently developed with two hotels, commercial space and surface parking lots. The two hotels will remain. The proposed development will occur primarily on the surface parking lots, although some of the existing commercial space will be

[1] The low-income rents utilized were the Federal low-income rates. These are approximately the same as the State of California moderate income rates.

demolished. This results in construction and development inefficiencies, which increase the overall costs of the projects compared to projects developed on cleared sites. The key direct cost assumptions are shown in Table 1 and described below:

1. KMA used the Developer's estimates for offsite improvements ($600,000 per site) and demolition ($600,000 for PCC North & Fairfield and $250,000 for PCC South).

2. KMA estimated sitework costs at $25 per square foot of land on the PCC South site and $20 per square foot for the PCC North & Fairfield site. These assumptions are consistent with other projects but are less than the Developer estimates of $52 per square foot for PCC south and $38 per square foot for PCC North & Fairfield.

3. Parking costs are estimated at $33,000 per space for the PCC South site and $30,000 per space for the PCC North & Fairfield site. The subterranean parking level on the PCC South site increases its cost per space. These assumptions are consistent with other projects but are less than the Developer estimates of approximately $39,000 per space for PCC South and $36,700 for PCC North & Fairfield.

4. Building costs are estimated at $190 per gross square foot for the PCC South project and $200 per gross square foot for the PCC North & Fairfield project. These assumptions are consistent with other projects but are less than the Developer estimates of $211 per gross square foot tor PCC South and $204 per gross square foot for PCC North & Fairfield.

5. Tenant improvement costs for the retail space are estimated at $60 per square foot.

6. Contractor fees, insurance costs and contingency allowance are assumed at 12%, 2.0% and 5.0%, respectively.

7. The architecture, engineering and consultant costs are estimated at 7.0% of direct costs, which is consistent with industry standards.

8. Based on information provided by the Developer, the permits and fees are estimated at $2.8 million for PCC South and $3.3 million for PCC North & Fairfield.

9. The taxes, insurance, legal and accounting costs are estimated at 2.0% of direct costs, which is within the range of typical costs (1.0% to 3.0%).

10. Typical development management fees range from 3% to 5% of direct costs. Given the large-scale of the overall Project, a 3.5% development management fee is assumed.

11. A standard contingency allowance of 5% of indirect costs is assumed.

12. The capitalized financing costs are estimated at nearly $2.8 million for the PCC South project and nearly $3.5 million for the PCC North & Fairfield project.

Overall project costs are shown below.

	PCC South	**PCC North & Fairfield**	**Total**
Direct Costs	$49,652,000	$64,000,000	$113,652,000
Indirect Costs	10,137,000	12,654,000	22,791,000
Financing Costs	2,804,000	3,460,000	6,264,000
Total Costs	$62,593,000	$80,114,000	$142,707,000

Total overall development cost for the PCC South component is nearly $62.6 million and over $80.1 million for the PCC North & Fairfield component for a total cost of $142.7 million. KMA believes the construction costs are reasonable for a project of this type to move forward.

The development cost information provided by the Developer was significantly higher than the KMA estimates. The Developer's estimate of total costs was $155.7 million. The Developer's conceptual development costs seem high and KMA expects that they will decline if the project moves forward.

Estimated Net Operating Income

The estimates of stabilized net operating income are shown in Table 2 of Attachments 1 and 2. The stabilized net operating income is estimated assuming a project is 95% occupied and is equal to total rent less total operating expenses.

In evaluating the market for the project KMA reviewed the Developer's pro forma, a market study prepared for the Developer, information included in the fiscal analysis prepared for the Developer and our own research of market rents in the El Segundo area. There is very little new rental product in the City, so the market area was expanded to include portions of the Cities of Los Angeles and Inglewood that are adjacent/near El Segundo even though their locations are inferior to this site. Average rents by unit type are shown below:

Unit Type	Monthly Rent	Rent per SF
Studio	$2,160	$3.76
One Bedroom	$2,469	$3.19
Two Bedroom	$3,160	$3.04

The above rents are averages for the larger market area. The various market analyses recognize that new rental product at this location will justify higher rents than the averages for existing product. In addition, the proposed units are being developed at a higher quality than the existing units in the area. As a result, KMA estimated the following rents for the projects.

Unit Type	PCC South Monthly Rent	PCC North & Fairfield Monthly Rent
Studio	$2,710	$2,804
One Bedroom	$3,217	$3,125
Two Bedroom	$4,283	$4,283

For this analysis KMA assumed miscellaneous revenues at $25 per unit and vacancy at 5.0% of revenues. Operating expenses including management and property taxes were estimated at $11,250 per unit. Residential apartment net operating income was estimated at $3,122,400 for PCC South and $3,510,000 for PCC North & Fairfield.

The nominal amount of retail space adds $202,400 of net income for PCC South (5,756 SF) and $193,100 of net income for PCC North & Fairfield (5,496 SF). Total stabilized net operating income for PCC South is $3,324,800 and $3,703,100 for PCC North & Fairfield, as shown in Table 2 of each Attachment.

Estimated Townhouse Sales Value

The PCC North & Fairfield component also include six for sale townhouse units. The proposed units are 1,590 square foot, three-bedroom units. Estimated price is $1,300,000 or nearly $820 per square foot. Gross sales revenues are estimated at $7,800,000. After allowing 6.0% of value for commissions and closing costs, the townhouses provide $7,332,000 of value to the Project.

Estimated Project Surplus/(Feasibility Gap)

The analysis of project feasibility is provided in Table 3 of Attachments 1 and 2. The evaluation compares the value of the completed project to the development costs, including an allowance for a reasonable developer profit. The remainder, in this case, represents what the developer can afford to pay for the site.

1. The NOI for the PCC South site is $3,324,800 and the PCC North & Fairfield site is $3,510,000.

2. Typical capitalization rates for apartment projects range from 4.0% to 5.5%, depending on location and quality level. The analysis utilizes a 4.5% capitalization rate reflecting a strong market and good location.

3. The projected value of the PCC South site at completion is $73,884,000 and the PCC North & Fairfield value is $82,291,000. The PCC North & Fairfield project has additional value from the townhouse units of $7,332,000 for a total value of $89,623,000.

From these amounts KMA deducts a 9% profit margin and the total development costs to derive a supportable land value.[2] This is the amount a developer would pay to the landowner to move forward with a project.

[2] Developers typically target a profit margin of between 8.0% and 10.0% of project value.

	PCC South	PCC North & Fairfield
Project Valuation	$73,884,000	$89,623,000
Less profit @ 9% of value	(6,650,000)	(8,066,000)
Less Development Costs	(62,593,000)	(80,114,000)
Supportable Land Value	$4,641,000	$1,443,000

The PCC South component has a supportable land value of approximately $4.6 million, while the PCC North & Fairfield component can support approximately $1.4 million for a total of nearly $6.1 million. The PCC North & Fairfield project is less profitable in part due to the less efficient parking structure required to provide replacement parking for the Fairfield Inn & Suites.

AFFORDABLE HOUSING

As noted at the beginning of this memorandum the Developer proposed to set aside 10% of the units to be affordable units. The Developer indicated that these units would be "workforce" units. For purposes of this analysis, KMA assumed that these units would be priced as low-income units using the Federal definition of low income.[3] Affordable rents are: Studio - $1,612 per month; One-bedroom - $1,716 per month; Two-bedroom - $2,055 per month. Also, KMA reduced the vacancy factor from 5% to 4% to reflect the lower turnover of affordable units.

The Developer proposed the following mix of affordable units at each site:

Unit Type	PCC South	PCC North & Fairfield
Studio	10 units	11 units
One Bedroom	1 unit	2 units
Two Bedroom	1 unit	1 unit

[3] The federal low-income limits are approximately the same as the California moderate income limits. These rents are net of utility costs.

The inclusion of the affordable units substantially reduces the value of the completed projects and what the Developer can pay for land, as shown below.

	PCC South	PCC North & Fairfield
Project Valuation	$71,164,000	$86,156,000
Less profit @ 9% of value	(6,405,000)	(7,754,000)
Less Development Costs	(62,563,000)	(80,076,000)
Supportable Land Value	$2,196,000	($1,674,000)

The inclusion of the affordable housing reduces the gross building value of the PCC South site by approximately $2.7 million and the value of the PCC North & Fairfield site by nearly $3.5 million for a total building value loss of approximately $6.2 million. The profit projected for the Developer and financing costs also decline somewhat. As a result, the overall supportable land value declines by $5.56 million to $522,000.

FISCAL ANALYSIS REVIEW

The Developer provided an initial fiscal analysis prepared by Stanley Hoffman Associates (SHA), dated June 8, 2020. KMA reviewed this report and identified several cost items that were overlooked and several underlying assumptions with which we disagreed. We discussed these issues with SHA. SHA issued a new report, dated April 23, 2021. This report incorporated most of KMA's comments and was updated to use the 2020-21 City Budget and updated employment and population estimates.

KMA reviewed the updated version and believes that it provides a reasonable estimate of the fiscal impact that the project will have on the City. The SHA report estimates that the Project (with the affordable housing units) will generate approximately $273,500 in annual City revenues but will incur approximately $401,200 in annual City service costs for a net annual cost to the City of approximately $127,600.

CONCLUSION

The City requested KMA undertake an independent review of the proposed overall project. The Developer proposed to intensify the development on three parcels that front on PCH between Holly Avenue and Palm Avenue. The properties are currently developed with hotels commercial buildings and surface parking lots.

KMA examined the overall feasibility of the project as both an all-market project and a project with 10% of the units set aside for 'workforce" housing assuming the federal low income rent limits. As part of its analysis KMA reviewed development costs, market rents and return and valuation requirements. As a result of our analysis KMA estimated that the all-market version of the Project can support a nearly $6.1 million land payment, indicating that this version of the project is feasible.

On the other hand, the version of the Project that includes 10% affordable housing is more problematic. The inclusion of the affordable units reduces the value of the overall project by nearly $5.5 million, which reduces the supportable land value to $522,000. This may still represent a feasible project provided the Developer and landowner can come to an agreement on price.

The Developer's conceptual analysis did not value the Project at completion. Instead, they prepared an equity cash flow projection of the project with the 10% affordable units. Using this methodology, KMA would expect to see equity internal rates of return between 15% and 20% for this type of project. The Developer's projections were significantly below that. Using the KMA methodology and the Developer's costs estimates, the Project cannot support any land value and instead shows a $24.6 million loss.

KMA also reviewed the fiscal analysis submitted by the Developer. It is KMA's opinion that the most recent submittal by the Developer's consultant provides a reasonable estimate of the Project's fiscal impact on the City. The Project with 10% affordable housing is projected to have a net annual cost to the City of approximately $127,600.

Memorandum

To: Mr. Lionel Uhry, Senior Vice President, Acquisitions & Development
Mar Ventures, Inc.

From: Bravish Mallavarapu, Director/Principal Economist

Date: April 23, 2021

Re: Fiscal Impact Analysis Update, Pacific Coast Commons, City of El Segundo
SRHA Job # 1385

This memorandum presents an updated fiscal impact analysis for the proposed Pacific Coast Commons development located within the City of El Segundo between Holly Ave and Palm Ave along the Pacific Coast Highway. This is an update to the original analysis, prepared and documented in our memo dated June 8, 2020, following changes to the project description, specifically the inclusion of affordable housing units, changes to the unit mix and rents, project new valuation, comments received from the City regarding the fiscal impact methodology, and updated City budget factors.

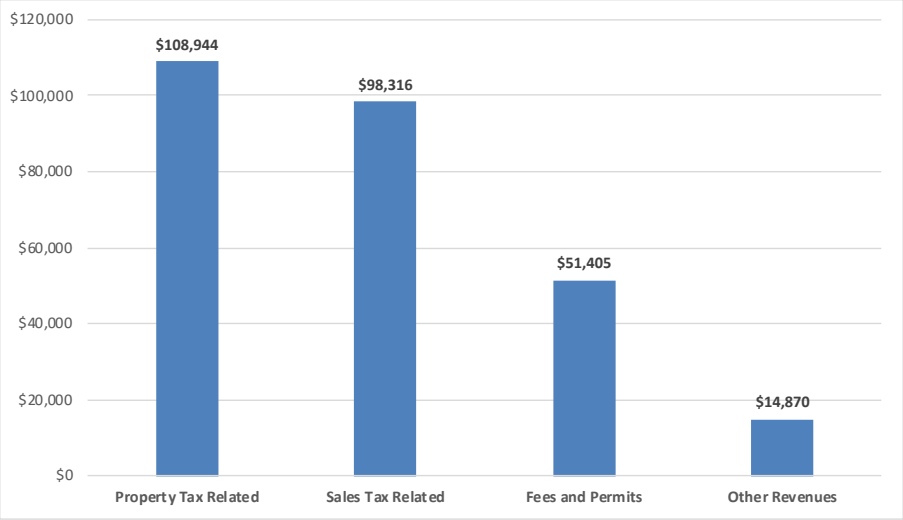
The proposed project includes the redevelopment of currently underutilized parking lots and commercial uses that serve the Fairfield Marriot and Loft hotels to alternate uses, including residential use (market and affordable units) and structured parking with ground floor commercial.

This updated analysis examines the annual recurring fiscal impacts of the proposed project at buildout on the City's General Fund presented in constant 2021 dollars. The analysis calculates the annual recurring revenues and annual recurring costs for operations and maintenance accruing to the City General Fund.

It is noted that based on discussions and direction provided by the City Finance Director, we have used the Adopted 2020-21 City Budget, passed by Council for a 9-month period, which we have extrapolated to a 12-month period to develop annual General Fund revenue and cost projection factors, applied to specific revenue and cost components of this fiscal analysis of the project.

1. Summary of Analysis

- The project adds 263 residential units, 11,000 square feet of commercial retail use and a structured commercial parking operation.
- The residential component includes 231 market rate apartment rental units, 26 affordable apartment rental units and 6 ownership townhomes.
- At project buildout the development is estimated to add a total of 252 households (occupied units) at a 4 percent vacancy rate with an estimated residential population of 395 persons, and an estimated 58 jobs associated with the commercial uses at 5 percent vacancy rate, parking operations and residential operations.



- The Pacific Coast Commons project adds new project valuation at buildout of $141 million, resulting in annual recurring all property tax related revenues of $105,091 to the City General Fund.
- Project households are estimated to account for a total of $31.8 million in aggregate annual household income with an annual average household income of $125,786.
- Retail and food spending by project residents and on-site employees is estimated at a total of about $5.6 million in taxable sales captured within the City.
- Combined with the on-site commercial retail operations, estimated annually at $3.4 million, the total sales tax generated from the project to the City General Fund is estimated at around $98,316 per annum.
- From the overall fiscal impact perspective, as shown in **Table 1**, the proposed Pacific Coast Commons project at buildout is estimated to generate $273,535 in annual recurring revenues, and $401,166 in annual recurring costs to the City General Fund in constant 2021 dollars.
- As shown in **Figure 1**, major annually recurring General Fund revenues include $108,944 in total property-related taxes, including the City General Fund share of the 1 percent property tax for $88,276, property tax in-lieu of VLF (PTVLF) for $16,815 and $3,853 for property transfer tax, sales-tax related revenues of $98,316 and all other revenues, including fees and permits, amounting to $66,275.
- Major annually recurring General Fund costs include $141,394 in Police Services, $103,347 for Fire Services, $22,760 for Recreation and Parks, $55,985 for Library Services, $16,719 in Public Works O&M (street maintenance). General Government costs of about $60,960 are projected at an overhead rate of 17.9 percent of the above line expenditure categories, as shown in **Figure 2**.

2. Project Description

Based on the information provided by the project proponent, as shown in **Figure 3 and Table 2**, the proposed Pacific Coast Commons project is spread over a total of five site areas, which also include the current Aloft Hotel (Area 2) and the Fairfield Marriot Hotel (Area 3) that remain unchanged. Three other sites including a surface parking lot (**Area 1**), an older commercial building (**Area 4**) and a second surface parking lot (**Area 5**) will be redeveloped to other uses as follows:

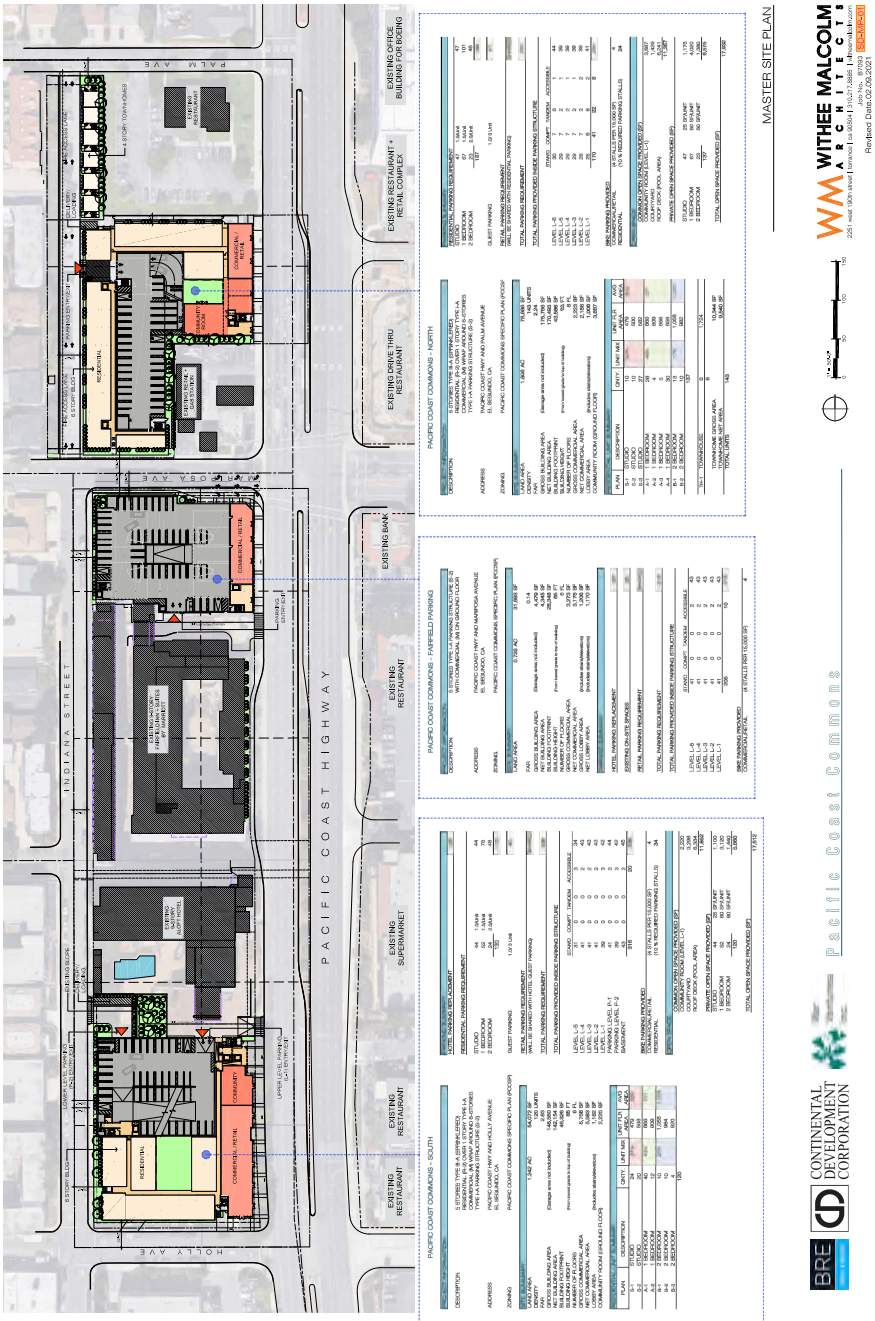
Area 1: The current surface parking lot will be redeveloped into a mixed-use development, which will include 120 multifamily units, including 12 affordable units, a clubhouse, gym and pool, and 6,200 square feet of ground floor commercial. Area 1 is zoned as general commercial – G3.

Area 4: Current uses include the old Carrasco's Restaurant, no longer in operation, a Discovery Rent-A-Car business, and ballroom and meeting area for the hotel used periodically. The site will be primarily redeveloped as structured parking for 187 parking spaces and will include 2,800 square feet of ground floor commercial. Area 4 is currently zoned as general commercial – G3.

Area 5: The current surface parking lot will be redeveloped to include residential, commercial and structured parking uses. Mixed use development will include 137 multifamily rental units, including 14 affordable housing units, 2,000 square feet of ground floor commercial and structured parking. Additionally, this area will include 6 for-sale townhomes. Area 5 is currently zoned as parking – P.

Project Valuation

As shown in **Table 3**, based on the information provided by the project proponent, the total new valuation for the Pacific Coast Commons is estimated at around $140.1 million.



- This includes the mixed use project in Area 1 with a valuation of $60.4 million;
- The new structured parking in Area 4 is estimated at $12.0 million;
- The new development in Area 5, including the mixed-use multifamily development and the proposed townhomes, is estimated for $67.7 million.

Residential Population

The household population resulting from the residential use in Pacific Coast Commons is estimated by translating the unit mix by number of bedrooms proposed for the mixed-use project in Area 1 and the mixed-use project and townhomes in Area 5, as shown in **Table 4**.

Given typical variations found in household sizes across dwelling unit types, the total residential population for the two project areas is calculated by applying appropriate persons by household ratios to the rental multifamily units across studios, one-bedroom and two-bedroom units, and to the owner-occupied townhomes.

1. Persons per household by number of bedrooms estimated from the ACS PUMS microdata for the Public Use Microdata Area (PUMA) including the City of El Segundo.
2. Based on information provided by the project proponent.

Source: Stanley R. Hoffman Associates, Inc.
Census American Community Survey (ACS) 2018, Public Use Microdata Sample (PUMS)

Estimated persons per household ratios for the apartment units by number of bedrooms and owner-occupied townhomes were calculated from the American Community Survey (ACS) Public Use Microdata Sample (PUMS) for the year 2018. These estimates were developed for the Public Use Microdata Area (PUMA), including the City of El Segundo, GEOID 0603760. Additionally, a vacancy factor of about 5 percent is assumed to calculate the resulting number of households (occupied units).

Applying these ratios and assumptions, the total resident population for the Pacific Coast Commons is estimated at 395 persons over 252 households, accounting for a 4 percent vacancy rate, for an average household size of 1.56 persons per household, as shown in **Table 4**.

On-Site Employment

Employment generated within the Pacific Coast Commons is estimated for on-site commercial operations associated with the ground floor commercial space across the three areas. Additionally, jobs generated for residential operations and maintenance are also estimated based on gross building square feet. Parking operations are assumed only for the dedicated parking structure in Area 4, while residential parking is assumed to be part of the residential operations in Area 1 and Area 5. Full-time equivalent (FTE) job numbers are calculated by applying industry-standard square feet per employee factor to the project gross leasable area (GLA) information assuming a 5 percent vacancy factor provided by the project proponent, as shown in **Table 5**.

Source: Stanley R. Hoffman Associates, Inc.
Mar Ventures, Inc.

3. Projected Household and Employee Expenditures

The Pacific Coast Commons will generate benefits to the City of El Segundo in terms of expenditures on retail goods and services made primarily by the new residents, and additionally by employees working on-site. At the same time, these expenditure levels depend considerably on the income characteristics of the households across the housing unit types proposed, and the type of on-site jobs and their associated wages estimated for the project.

Household Income and Expenditure Characteristics

The average household income of the households projected for the Pacific Coast Commons is estimated across the housing product types (unit mix) for the project. This is based on the average monthly housing cost by housing type, which is assumed to constitute, using conventional standards, 30 percent of the household income. While this percentage share has moved progressively to the 40 percent mark in recent times, current federal, state and local policy standards still continue to use the lower number.

As shown in **Table 6**, proposed monthly rents for the project market-rate and affordable units, have been provided by the project proponent. Rents for market-rate units range from $2,804 for studios to $4,283 for two-bedroom apartments. Rents for affordable units range from $1,528 for studios to $2,028 for two-bedroom apartments. Townhomes are estimated for a sale price of about $1.3 million, which translates to a monthly ownership cost of approximately $6,200.

This implies a range of minimum household incomes that can meet the conventional 30 percent income threshold that the Pacific Coast Commons aims to attract within El Segundo. Estimated average annual household incomes for the apartments range from $63,000 to $171,320 indicating a fit with a mix of professional office and workforce segment that the City of El Segundo has attracted over the last decade. Average household income for townhomes is estimated at $248,000 per annum.

Applying the estimated average annual household income to the number of households by each housing category results in the aggregate annual income for that category, as shown in **Table 6**. Summing up all the household categories further results in a total of $31.8 million aggregate annual household income for the Pacific Coast Commons project, as shown in **Table 7**.

The City of El Segundo will benefit from the spending potential of households living in the Pacific Coast Commons. This potential is estimated from the aggregate household income, as shown in **Table 8**. Examining household spending patterns from the US Bureau of Labor Statistics (BLS) Consumer Expenditure Survey (CES), it is estimated that households in the Los Angeles-Long Beach-Anaheim MSA spent around 21.1 percent of their pre-tax income on retail and local services items. When applied to the aggregate household income of $31.8 million for the project, the total household spending potential is calculated at $6.71 million per annum on food and discretionary products and services, as shown in **Table 7**.

US Bureau of Labor Statistics (BLS), Consumer Expenditure Survey (CES), 2018-19.

Projected Employee Expenditures

In addition to households, potential spending on retail goods and services also originate from workers employed within the Pacific Coast Commons. These purchases are typically made over during work breaks in and around the place of work. This spending potential is calculated from the jobs estimated for the project, as shown previously in Table 6. It is assumed that these jobs are entry-level, clerical and operational functions across the commercial uses, and parking and residential operations of the proposed project.

Based data from the International Council of Shopping Centers (ICSC) for 2012, adjusted for inflation, workers in entry-level, clerical and support functions spend about $73 per week or $3,796 per annum on retail, food and services. Applied to the estimated 58 workers for the project, this results in $209,160 of annual spending on these taxable sales categories made around the workplace within El Segundo.

4. Project On-Site Taxable Sales

The proposed project additionally generates taxable retail sales from the commercial use space planned for the development. Based on inputs from the project proponent, the total 10,450 square feet of retail use, including a 5 percent vacancy rate, is distributed across limited service restaurants, health and personal care stores, and miscellaneous retail stores, as shown in **Table 9**. Using industry sales per square foot factors, these uses generate a total of $3.40 million in taxable sales at buildout, as shown below.

Table 9
On-Site Retail Sales
Pacific Coast Commons, City of El Segundo
(Constant 2021 Dollars)

Retail Categories	GLA [1]	Occcupied GLA [1]	Sales/SF [2]	Sales [3]	Taxable Percent	Taxable Sales	Sales Tax
Limited-service restaurants	3,700	3,515	$355	$1,247,757	100%	$1,247,757	$12,478
Retail - Health and personal care stores	3,650	3,468	$368	$1,275,284	100%	$1,275,284	$12,753

5. Fiscal Analysis Details

The final section of this memo examines the annual recurring fiscal impacts of the proposed project at buildout on the City's General Fund in constant 2021 dollars. The analysis calculates the annual recurring General Fund revenues and costs for operations and maintenance at buildout, shown in **Table 10**, with the fiscal analysis methodology shown in **Appendix A**. General city-wide assumptions including service population estimation are shown in Appendix Table A-1, General Fund revenue factors in Table A-2, and General Fund cost factors in Table A-3.

Fiscal Impact Summary

The proposed Pacific Coast Commons mixed-use project at buildout is estimated to generate around $273,535 in annual recurring revenues, and $401,166 in annual recurring costs to the City General Fund, in constant 2021 dollars, as shown in **Table 10.**

Annual Recurring Revenues Details

The annual recurring General Fund revenues include four broad categories, including property-related, sales-related, fees and permits, and other city-specific revenues. The detailed revenue and costs for the proposed project are shown in **Table 10**.

- Property Tax Related: The total annual recurring revenues for the proposed project at buildout includes $88,276 in the City General Fund portion of the 1 percent property tax and $16,815 in property tax in-lieu of the motor vehicle license fee (PTVLF), as calculated in **Appendix Table A-6**. Property transfer tax additionally is estimated at $3,853.
- Sales-tax related revenues, composed of the 1 percent sales tax and a separate use tax, from both on-site sales and off-site expenditures is estimated at $98,316, as calculated in **Appendix Table A-9**.
- Fees and permits, including franchise fees, business license fees and utilities user tax, amount to $51,405. The balance of revenues of $14,870 includes a combination of different city service related charges and fees, based on revenue factors developed in **Appendix Table A-2**.

Annual Recurring Cost Details

The annual recurring General Fund costs include six categories, including Police Services, Fire Services, Recreation and Parks, Library Services, Public Works O&M and General Government, as shown in **Table 10**.

- Police Services: These costs have been developed on a service population basis, as shown in **Appendix Table A-10**. The project is estimated to generate annual police services costs of $141,394, based on an estimated service population of 439 persons.
- Fire Services: These costs have been developed on a service population basis, as shown in **Appendix Table A-10**. The project is estimated to generate annual police services costs of $103,347, based on an estimated service population of 439 persons.
- Recreation and Parks Services: These costs have been developed on a service population based on General Fund expenditure factors, shown in **Appendix Table A-3**. The project is estimated to generate recreation and park services costs of $22,760, based on an estimated service population of 439 persons.

- Library Services: These costs have been developed on a resident population based on GF expenditure factors, shown in **Appendix Table A-3**. The project is estimated to generate library services costs of $55,985, based on an estimated project resident population of 395 persons.
- Public Works Operations and Maintenance: These costs have been developed for public street maintenance O&M, shown in **Appendix Table A-12**. The project is estimated to generate $16,719 of street costs, based on an estimated 0.397 lineal miles of public street adjacent to the project.
- General Government costs are projected at an overhead rate of 17.9 percent of the above line expenditures, as calculated in **Appendix Tables A-3 and A-5**.

APPENDIX A

Fiscal Impact Methodology

Annual recurring impacts on the City of El Segundo General Fund from the proposed Pacific Coast Commons are projected based on a combination of assumptions, including those related to project development, revenues and costs, in constant 2021 dollars.

These impacts are projected based on a specific set of general assumptions, revenue and cost factors, as shown in **Appendix Tables A-1 through A-3**.

Further, the revenue and cost factors have been developed, as applicable, based on project specific factors and service population related factors, which were developed by analyzing the City's Adopted 9-month Annual Budget for 2020-21, adjusted per City Finance Director guidance, to an annual 12-month basis.

The recurring annual revenue and cost categories identified from the City Adopted Annual Budget, are shown in **Appendix Tables A-4 and A-5**.

Property tax calculations, including the City share of the 1% property tax and the property in-lieu of the motor vehicle license fee (PTVLF) for the project is shown in **Appendix Table A-6**. City PTVLF factor calculation is shown in **Appendix Table A-7**.

Business license tax calculations for the commercial operations for the proposed project is shown in **Appendix Table A-8**. These fees are specific to the type and size of establishments.

Sales and use tax calculations for the onsite commercial operations for the proposed project is shown in **Appendix Table A-9**. The table also shows the offsite sales and use tax impacts on the City from the expenditures of the new project residents and employees.

Police and Fire Services costs incurred by the proposed project is shown in **Appendix Table A-10**. These are based on service call and related department cost trends for the City, as shown in **Appendix Table A-11.**

Public Works (Street Maintenance O&M) are shown in **Appendix Table A-12**.

Appendix Table A-1
City General Assumptions
City of El Segundo, 2020-21

Assumption	Description
	Population and Housing [1]
16,701	Total Household Population
76	Group Quarters Population
16,777	Total Resident Population
3,576	Single Family Units (Detached, Attached, Mobile Homes)
3,887	Multi-Family Units (2 Plus Units per Structure)
7,463	Total Housing Units
7,111	Occupied Housing Units
2.38	Citywide Average Household Size
	Employment
76,207	Total City Employment [2]
	Service Population [3]
16,777	Total Resident Population
57,155	Employment (75% of total city employment)
73,932	**Total Service Population**

1. Population and housing numbers are January 1, 2020 estimates provided by the California Department of Finance (DOF).
2. Employment estimate based on total primaty jobs in 2018 reported by Census LEHD for El Segundo, adjusted for a 10 percent self-employment rate. Total primary jobs are reported at 68,586.
3. This analysis defines the service population as population plus 75 percent of employment for the El segundo context.

Appendix Table A-2
Summary of General Fund Recurring Revenue Factors
City of El Segundo

General Fund Revenue Source	FY 2020-21 Adjusted Budget [1]	Projection Basis [2]	Projection Factor
General Property Tax	$12,193,367	Case Study: Project Valuation	6.32% City general share of 1% levy
VLF Swap (Property Tax in Lieu VLF)	$2,512,596	Case Study	$120 per $1,000,000 assessed valuation
Real Property Transfer Tax	$666,667	Property turnover and valuation assumptions	5.0% Turnover rate $0.55 per $1,000 assessed valuation
Sales and Use Tax	$11,164,911	Taxable Sales	100% of 1% of projected sales and use tax
Use Tax Factor		Use Tax as Percent of Sales Tax	14.3% of sales tax
Franchise Tax	$3,000,000	Service Population = 73,932	$40.58 per service population
Utility User Tax	$4,992,063	Service Population = 73,932	$67.52 per service population
Business Licenses [3]	$13,985,813	Case Study	varies by alternative
Paramedic Transport Charges	$700,000	Service Population = 73,932	$9.47 per service population
Administrative Charges	$1,136,819	Service Population = 73,932	$15.38 per service population
City Code and Parking Fines and Forfeitures	$382,667	Service Population = 73,932	$5.18 per service population
Property Rentals and Parking-In-Lieu Fees	$224,000	Service Population = 73,932	$3.03 per service population
Sales of Reports, Documents, Cable DVDs	$3,133	Service Population = 73,932	$0.04 per service population
Miscellaneous Revenue	$60,000	Service Population = 73,932	$0.81 per service population

1. Based on direction from City Staff, the 9-month 2020-21 Adopted Budget has been extrapolated over a 12-month annual period.
2. This analysis assumes service population as total population plus 75% of employment.
3. The calculation of business license tax is presented in Table A-8.

Appendix Table A-3
Summary of General Fund Recurring Cost Factors
City of El Segundo

Cost Category	FY 2020-21 Adjusted Adopted Budget [1] Total	Net	Projection Basis [2]	Cost Factor
General Government - Overhead [3]	$18,106,457	$10,863,874	Share of Line Costs at 60% Marginal Rate	17.9% of direct department costs
Police Department [4]	$23,839,367	$23,839,367	Service Population = 73,932	$322.45 per Per Capita Service Population
Fire Department [5]	$17,424,524	$17,424,524	Service Population = 73,932	$235.68 per Per Capita Service Population
Recreation and Parks [5]	$3,837,395	$3,837,395	Service Population = 73,932	$51.90 per Capita Service Population
Library Services [5]	$2,377,885	$2,377,885	Resident Population = 16,777	$141.73 per Capita Resident Population
Planning and Building Safety [6]	$3,478,699	$74,232	Service Population = 73,932	not projected
Street Maintenance [7]	$2,798,792	$2,665,833	City Street Mile = 63.3	$42,114 per street mile

1. Based on direction from City Staff, the 9-month 2020-21 Adopted Budget has been extrapolated over a 12-month annual period.
2. This analysis assumes service population as total population plus 75% of total employment.
3. Based on previous studies, general government services for the proposed project are projected at 60 percent of the current overhead rate because the proposed project will not require a one for one increase in staffing and services.
4. Projected police and fire costs are presented in Appendix Table A-10. Police and fire costs are projected based on costs per call calculated from data provided by police and fire department staff, as shown in Appendix Table A-11.
5. Recreation and parks based on annual budget expenditures attributed to service population, while library services factor based on annual budget expenditures attrubuted to residential population.
6. Planning and building safety costs are not projected because estimated one-time permits, fees and charges for services are estimated to cover planning and building safety costs.
7. Net street maintenance costs of $2,665,833 are based on the 2020-21 adopted budget of $2,798,792 minus the estimated one-time revenues, as shown in Appendix Table A-12.

Re: Pacific Coast Commons

Dear Members of the El Segundo Planning Commission,

I am writing on behalf of the El Segundo Chamber of Commerce in support of the proposed Pacific Coast Commons project on Pacific Coast Highway in El Segundo. This project will have a positive impact on our business community which will be beneficial to our city.

As the City of El Segundo continues our growth with "big ideas taking off", providing housing for our current and future residents is of utmost importance. Additional housing closer to employment centers not only reduces traffic and congestion but also provides a better quality of life for our employees. In addition, these residents will shop, dine, play, and volunteer in our community thus contributing to our financial and overall well-being.

The Pacific Coast Commons project beautifies a highly visible area of our City as well as contributes to the State mandated housing goals. The developers of this project have proven their commitment to El Segundo with community involvement as well as projects that have added to the desirability of El Segundo for many years.

Please accept this letter as an endorsement of the Pacific Coast Commons project from the El Segundo Chamber of Commerce.

Please feel free to contact me at 310-322-1220 or director@elsegundochamber.org if you have any questions.

Best regards,

Marsha Hansen

Subject: Pacific Coast Commons Specific Plan

Hello,

This email is in regard to the Pacific Coast Commons Specific Plan on 475-629 North Pacific Coast Highway.

I live at 403, Indiana Street, Unit 25, El Segundo CA 90245 and am writing this email because I oppose the project. Parking is already difficult in the streets surrounding my apartment and the construction will only make matters worse. Construction also picks up plenty of dust that will surely make its way into neighboring windows.

Thank you,
Jack A Cool

Subject: Pacific Coast Commons Concern

Hi,

I'm a resident of condos on Illinois and Pine and wanted to raise a very big concern about the availability of street parking both during and after the constructions of the Pacific Coast Commons.

It is already incredibly difficult to find street parking for residents in the area due to hotel patrons parking on the street as opposed to in the designated parking lots. With the potential construction and elimination of parking for hotel patrons that will only get worse. Will permit parking be put in place to protect residence and allow them and their guests to find already limited parking on the streets?

Thank you,
Jennie

2 List of Verbal Commenters 1

INTENTIONALLY LEFT BLANK

Section 1. Introduction

All comment letters received by the City of El Segundo ("City") through December 9, 2021 have been included and responded to herein. Comments that raise environmental issues pertinent to the analysis presented in the EIR have been thoroughly addressed in these responses. The City received comment letters from two organizations prior to the City's Planning Commission meeting on December 9, 2021, and verbal comments were also presented at the meeting.

For the new comment letters received, individual comments within the body of each letter have been identified and numbered. Brackets delineating the individual comments and a numeric identifier have been added to the right margin of the letter. Responses to each bracketed comment are included on the page(s) following each comment letter. Table 1 lists the comment letters received, including the commenting organization's name; the assigned numbering; and the date of the correspondence for responses provided in Section 2, Written Comments.

Table 1. List of Comment Letters Received

Comment Letter	Name	Type	Date
1	Southwest Regional Council of Carpenters (via Mitchell M. Tsai, Attorney at Law)	Organization	December 8, 2021
2	Supporters Alliance for Environmental Responsibility ("SAFER", via Lozeau Drury LLP)	Organization	December 9, 2021

Members of the public who attended the City's Planning Commission meeting on December 9, 2021 were also given opportunities to provide verbal comments. The individuals that provided comments are listed in Table 2. Written transcriptions of the verbal comments are provided, with brackets delineating the individual comments and a numeric identifier have been added to the right margin. Responses to each bracketed comment are included on the page(s) following each comment letter. Table 2 lists the commenters from the City's Planning Commission meeting on December 9, 2021 and the assigned numbering for responses provided in Section 3, Verbal Comments.

Table 2. List of Verbal Commenters

Comments	Name	Type	Date
1	Nino Mascolo	Individual	December 9, 2021
2	Byron Washum	Individual	December 9, 2021
3	Ray Lawson (Southwest Regional Council of Carpenters)	Individual	December 9, 2021
4	Paul Morrison	Individual	December 9, 2021
5	Amalia Fuentes - Supporters Alliance for Environmental Responsibility ("SAFER")	Individual	December 9, 2021
6	Maria Barron	Individual	December 9, 2021
7	Matthew Klemp	Individual	December 9, 2021

As presented in Sections 2 and 3 below, none of the comment received identified deficiencies in the Draft or Final EIR analyses that would require recirculation of the EIR pursuant to CEQA Guidelines Section 15088.5.

CEQA Guidelines Section 15088.5, Recirculation of an EIR Prior to Certification, is presented below for reference:

(a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before

certification. As used in this section, the term "information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation include, for example, a disclosure showing that:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (*Mountain Lion Coalition v. Fish and Game Com.* (1989) 214 Cal.App.3d 1043)

Although no comments have been raised that would require revisions to the Final EIR, these comments are available to the City's decision makers for their review and consideration as part of their deliberations on the Project's environmental documentation.

RE: Agenda Item No. H-1: Pacific Coast Commons Specific Plan Project

Dear Chair Baldino and Honorable Commissioners,

On behalf of the Southwest Regional Council of Carpenters ("**Southwest Carpenters**" or "**SWRCC**"), my Office is submitting these comments on Agenda Item No. H-1 for the November 18, 2021 City Planning Commission Meeting for the City of El Segundo's ("**City**" or "**Lead Agency**") Final Environmental Impact Report ("**FEIR** or **DEIR**") (SCH No. 2020050508) for the Pacific Coast Commons Specific Plan Project. The Project proposes to demolish existing structures, including a former restaurant with meeting/ballroom space, a rental car tenant, and the existing surface parking lots of the Fairfield Inn & Suites by Marriott and Aloft Hotel properties, and would allow for the development of up to 263 new housing units and approximately 11,250 gross square feet of new commercial/retail uses, and associated parking. ("**Project**").

1-1

The Southwest Carpenters is a labor union representing 50,000 union carpenters in six states and has a strong interest in well ordered land use planning and addressing the environmental impacts of development projects.

Individual members of the Southwest Carpenters live, work and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

The Southwest Carpenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); *Bakersfield*

Citizens for Local Control v. Bakersfield (2004) 124 Cal. App. 4th 1184, 1199-1203; see *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121.

SWRCC incorporates by reference all comments raising issues regarding the EIR submitted prior to certification of the EIR for the Project. *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal. App. 4th 173, 191 (finding that any party who has objected to the Project's environmental documentation may assert any issue timely raised by other parties).

1-1 Cont.

Moreover, SWRCC requests that the Lead Agency provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act ("**CEQA**"), Cal Public Resources Code ("**PRC**") § 21000 *et seq*, and the California Planning and Zoning Law ("**Planning and Zoning Law**"), Cal. Gov't Code §§ 65000–65010. California Public Resources Code Sections 21092.2, and 21167(f) and Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

1-2

The City should require the Applicant provide additional community benefits such as requiring local hire and use of a skilled and trained workforce to build the Project. The City should require the use of workers who have graduated from a Joint Labor Management apprenticeship training program approved by the State of California, or have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state approved apprenticeship training program or who are registered apprentices in an apprenticeship training program approved by the State of California.

Community benefits such as local hire and skilled and trained workforce requirements can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project Site can reduce the length of vendor trips, reduce greenhouse gas emissions and providing localized economic benefits. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project Site can reduce the length of vendor trips, reduce greenhouse gas emissions and providing localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

1-3

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Skilled and trained workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the UC Berkeley Center for Labor Research and Education concluded:

> . . . labor should be considered an investment rather than a cost – and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

Recently, on May 7, 2021, the South Coast Air Quality Management District found that the "[u]se of a local state-certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.[2]

Cities are increasingly adopting local skilled and trained workforce policies and requirements into general plans and municipal codes. For example, the City of Hayward 2040 General Plan requires the City to "promote local hiring . . . to help achieve a more positive jobs-housing balance, and reduce regional commuting, gas consumption, and greenhouse gas emissions."[3]

[2] South Coast Air Quality Management District (May 7, 2021) Certify Final Environmental Assessment and Adopt Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305, Submit Rule 2305 for Inclusion Into the SIP, and Approve Supporting Budget Actions, *available at* http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-May7-027.pdf?sfvrsn=10

[3] City of Hayward (2014) Hayward 2040 General Plan Policy Document at p. 3-99, *available at* https://www.hayward-ca.gov/sites/default/files/documents/General_Plan_FINAL.pdf.

In fact, the City of Hayward has gone as far as to adopt a Skilled Labor Force policy into its Downtown Specific Plan and municipal code, requiring developments in its Downtown area to requiring that the City "[c]ontribute to the stabilization of regional construction markets by spurring applicants of housing and nonresidential developments to require contractors to utilize apprentices from state-approved, joint labor-management training programs, . . ."[4] In addition, the City of Hayward requires all projects 30,000 square feet or larger to "utilize apprentices from state-approved, joint labor-management training programs."[5]

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[6]

In addition, local hire mandates as well as skill training are critical facets of a strategy to reduce vehicle miles traveled. As planning experts Robert Cervero and Michael Duncan noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions since the skill requirements of available local jobs must be matched to those held by local residents.[7] Some municipalities have tied local hire and skilled and trained workforce policies to local development permits to address transportation issues. As Cervero and Duncan note:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing." The

> city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

1-3 Cont.

The City should consider utilizing skilled and trained workforce policies and requirements to benefit the local area economically and mitigate greenhouse gas, air quality and transportation impacts.

The City should also require the Project to be built to standards exceeding the current 2019 California Green Building Code to mitigate the Project's environmental impacts and to advance progress towards the State of California's environmental goals.

I. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

CEQA has two basic purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 California Code of Regulations (**"CCR"** or **"CEQA Guidelines"**) § 15002(a)(1).[8] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made. Thus, the EIR 'protects not only the environment but also informed self-government.' [Citation.]" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564. The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs.* (2001) 91 Cal.

1-4

[8] The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 *et seq*, are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. (Cal. Pub. Res. Code § 21083.) The CEQA Guidelines are given "great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous." *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal. 4th 204, 217.

App. 4th 1344, 1354 (*"Berkeley Jets"*); *County of Inyo v. Yorty* (1973) 32 Cal. App. 3d 795, 810.

Second, CEQA directs public agencies to avoid or reduce environmental damage when possible by requiring alternatives or mitigation measures. CEQA Guidelines § 15002(a)(2) and (3). *See also, Berkeley Jets,* 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553; *Laurel Heights Improvement Ass'n v. Regents of the University of California* (1988) 47 Cal. 3d 376, 400. The EIR serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in CEQA section 21081. CEQA Guidelines § 15092(b)(2)(A–B).

While the courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position.' A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" *Berkeley Jets*, 91 Cal.App.4th 1344, 1355 (emphasis added) (quoting *Laurel Heights*, 47 Cal.3d at 391, 409 fn. 12). Drawing this line and determining whether the EIR complies with CEQA's information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. Cnty. of Fresno* (2018) 6 Cal. 5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal. App. 4th 48, 102, 131. As the court stated in *Berkeley Jets*, 91 Cal. App. 4th at 1355:

> A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process.

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the

1-4 Cont.

project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Communities for a Better Environment v. Richmond* (2010) 184 Cal. App. 4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449–450).

1-4 Cont.

B. CEQA Requires Revision and Recirculation of an Environmental Impact Report When Substantial Changes or New Information Comes to Light

Section 21092.1 of the California Public Resources Code requires that "[w]hen significant new information is added to an environmental impact report after notice has been given pursuant to Section 21092 … but prior to certification, the public agency shall give notice again pursuant to Section 21092, and consult again pursuant to Sections 21104 and 21153 before certifying the environmental impact report" in order to give the public a chance to review and comment upon the information. CEQA Guidelines § 15088.5.

Significant new information includes "changes in the project or environmental setting as well as additional data or other information" that "deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative)." CEQA Guidelines § 15088.5(a). Examples of significant new information requiring recirculation include "new significant environmental impacts from the project or from a new mitigation measure," "substantial increase in the severity of an environmental impact," "feasible project alternative or mitigation measure considerably different from others previously analyzed" as well as when "the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." *Id.*

1-5

An agency has an obligation to recirculate an environmental impact report for public notice and comment due to "significant new information" regardless of whether the agency opts to include it in a project's environmental impact report. *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 74, 95 [finding that in light of a new expert report disclosing potentially significant impacts to groundwater supply "the EIR should have been revised and recirculated for purposes of informing the public and governmental agencies of the volume of groundwater at risk and to allow the public and governmental agencies to respond to such information."]. If significant new information was brought to the attention of an agency prior to certification, an agency

is required to revise and recirculate that information as part of the environmental impact report.

Here, the City has made significant revisions to the Draft EIR which are detailed in the FEIR beginning on page 3-1 of that document. These revisions require recirculation of the EIR for an additional public comment period. These are not minor non-substantive revisions.

The City has significantly altered its transportation and cumulative impacts analyses. The City has now added three additional related projects and attached them to the FEIR as Appendix A in the *Revised Future Analysis*. As a result, all related impacts are substantially altered and the EIR needs to be recirculated to allow for adequate public review and comment. The City has changed its transportation analysis as it relates to trip generation, traffic volume, and level of service analysis. (See FEIR, Appendix A.) These changes are accompanied by dozens of pages of expert data analysis that cannot be left to the public for a last-minute glance.

1-5 Cont.

C. The FEIR Failed to Respond to SWRCC's and Expert's Comments

CEQA requires that a lead agency "evaluate comments on environmental issues received from persons who reviewed the draft EIR" and provide a written response with good faith and reasoned analysis. CEQA Guidelines § 15088. The responses are required to be provided in a revision to the draft EIR or in a separate section in the final EIR. *Id.*

SWRCC submitted comments to the DEIR on April 12, 2021 addressed to Planner Paul Samaras. Upon review of the FEIR, it does not appear that the City responded to or considered SWRCC's comments. Those comments are attached hereto as Exhibit A for the City's renewed consideration. A copy of the e-mail where my Office transmitted these comments are attached as Exhibit B.

1-6

III. **CONCLUSION**

Commenters request that the City deny the Project's proposed Site Plan Review and any other discretionary approvals the City finds necessary and order the revision and recirculation of the Project's environmental impact report to address the aforementioned concerns.

1-7

RE: Pacific Coast Commons Specific Plan Project

Dear Mr. Samaras,

On behalf of the Southwest Regional Council of Carpenters ("**Commenter**" or "**Carpenter**"), my Office is submitting these comments on the City of El Segundo's ("**City**" or "**Lead Agency**") Draft Environmental Impact Report ("**DEIR**") (SCH No. 2020050508) for the Pacific Coast Commons Specific Plan Project which would demolish existing structures, including a former restaurant with meeting/ballroom space, a rental car tenant, and the existing surface parking lots of the Fairfield Inn & Suites by Marriott and Aloft Hotel properties, and would allow for the development of up to 263 new housing units and approximately 11,250 gross square feet of new commercial/retail uses, and associated parking. ("**Project**").

The Southwest Carpenters is a labor union representing 50,000 union carpenters in six states and has a strong interest in well ordered land use planning and addressing the environmental impacts of development projects.

Individual members of the Southwest Carpenters live, work and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Commenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal. App. 4th 1184, 1199-1203; see *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121.

1-8

Commenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal. App. 4th 1184, 1199-1203; see *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121.

Commenters incorporates by reference all comments raising issues regarding the EIR submitted prior to certification of the EIR for the Project. *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal. App. 4th 173, 191 (finding that any party who has objected to the Project's environmental documentation may assert any issue timely raised by other parties).

1-8 Cont.

Moreover, Commenter requests that the Lead Agency provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act ("**CEQA**"), Cal Public Resources Code ("**PRC**") § 21000 *et seq*, and the California Planning and Zoning Law ("**Planning and Zoning Law**"), Cal. Gov't Code §§ 65000–65010. California Public Resources Code Sections 21092.2, and 21167(f) and Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

1-9

The City should require the Applicant provide additional community benefits such as requiring local hire and use of a skilled and trained workforce to build the Project. The City should require the use of workers who have graduated from a Joint Labor Management apprenticeship training program approved by the State of California, or have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state approved apprenticeship training program or who are registered apprentices in an apprenticeship training program approved by the State of California.

Community benefits such as local hire and skilled and trained workforce requirements can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project Site can reduce the length of vendor trips, reduce greenhouse gas emissions and providing localized economic benefits. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project Site can reduce the length of vendor trips,

1-10

reduce greenhouse gas emissions and providing localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Skilled and trained workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the UC Berkeley Center for Labor Research and Education concluded:

> . . . labor should be considered an investment rather than a cost – and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

The City should also require the Project to be built to standards exceeding the current 2019 California Green Building Code to mitigate the Project's environmental impacts and to advance progress towards the State of California's environmental goals.

1-10 Cont.

I. EXPERTS

This comment letter includes comments from air quality and greenhouse gas experts Matt Hagemann, P.G., C.Hg. and Paul Rosenfeld, Ph.D. concerning the DEIR. Their comments, attachments, and Curriculum Vitae ("CV") are attached hereto and are incorporated herein by reference.

Matt Hagemann, P.G., C.Hg. ("Mr. Hagemann") has over 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA

1-11

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf

and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Mr. Hagemann also served as Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closer. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring.

For the past 15 years, Mr. Hagemann has worked as a founding partner with SWAPE (Soil/Water/Air Protection Enterprise). At SWAPE, Mr. Hagemann has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality, and greenhouse gas emissions.

Mr. Hagemann has a Bachelor of Arts degree in geology from Humboldt State University in California and a Masters in Science degree from California State University Los Angeles in California.

Paul Rosenfeld, Ph.D. ("Dr. Rosenfeld") is a principal environmental chemist at SWAPE. Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts on human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risks, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particular matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants, Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert

1-11 Cont.

on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

1-11 Cont.

Dr. Rosenfeld has a Ph.D. in soil chemistry from the University of Washington, M.S. in environmental science from U.C. Berkeley, and B.A. in environmental studies from U.C. Santa Barbara.

II. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

CEQA has two basic purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 California Code of Regulations ("**CCR**" or "**CEQA Guidelines**") § 15002(a)(1).[2] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made. Thus, the EIR 'protects not only the environment but also informed self-government.' [Citation.]" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564. The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs.* (2001) 91 Cal. App. 4th 1344, 1354 ("*Berkeley Jets*"); *County of Inyo v. Yorty* (1973) 32 Cal. App. 3d 795, 810.

1-12

Second, CEQA directs public agencies to avoid or reduce environmental damage when possible by requiring alternatives or mitigation measures. CEQA Guidelines § 15002(a)(2) and (3). *See also, Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta*

[2] The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 *et seq*, are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. (Cal. Pub. Res. Code § 21083.) The CEQA Guidelines are given "great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous." *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal. 4th 204, 217.

Valley v. Board of Supervisors (1990) 52 Cal.3d 553; *Laurel Heights Improvement Ass'n v. Regents of the University of California* (1988) 47 Cal. 3d 376, 400. The EIR serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in CEQA section 21081. CEQA Guidelines § 15092(b)(2)(A–B).

While the courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position.' A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" *Berkeley Jets*, 91 Cal.App.4th 1344, 1355 (emphasis added) (quoting *Laurel Heights*, 47 Cal.3d at 391, 409 fn. 12). Drawing this line and determining whether the EIR complies with CEQA's information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. Cnty. of Fresno* (2018) 6 Cal. 5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal. App. 4th 48, 102, 131. As the court stated in *Berkeley Jets*, 91 Cal. App. 4th at 1355:

> A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process.

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Communities for a Better Environment v. Richmond* (2010) 184 Cal. App. 4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449–450).

1-12 Cont.

B. CEQA Requires Revision and Recirculation of an Environmental Impact Report When Substantial Changes or New Information Comes to Light

Section 21092.1 of the California Public Resources Code requires that "[w]hen significant new information is added to an environmental impact report after notice has been given pursuant to Section 21092 … but prior to certification, the public agency shall give notice again pursuant to Section 21092, and consult again pursuant to Sections 21104 and 21153 before certifying the environmental impact report" in order to give the public a chance to review and comment upon the information. CEQA Guidelines § 15088.5.

Significant new information includes "changes in the project or environmental setting as well as additional data or other information" that "deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative)." CEQA Guidelines § 15088.5(a). Examples of significant new information requiring recirculation include "new significant environmental impacts from the project or from a new mitigation measure," "substantial increase in the severity of an environmental impact," "feasible project alternative or mitigation measure considerably different from others previously analyzed" as well as when "the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." *Id.*

1-13

An agency has an obligation to recirculate an environmental impact report for public notice and comment due to "significant new information" regardless of whether the agency opts to include it in a project's environmental impact report. *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 74, 95 [finding that in light of a new expert report disclosing potentially significant impacts to groundwater supply "the EIR should have been revised and recirculated for purposes of informing the public and governmental agencies of the volume of groundwater at risk and to allow the public and governmental agencies to respond to such information."]. If significant new information was brought to the attention of an agency prior to certification, an agency is required to revise and recirculate that information as part of the environmental impact report.

C. Due to the COVID-19 Crisis, the City Must Adopt a Mandatory Finding of Significance that the Project May Cause a Substantial Adverse Effect on Human Beings and Mitigate COVID-19 Impacts

CEQA requires that an agency make a finding of significance when a Project may cause a significant adverse effect on human beings. PRC § 21083(b)(3); CEQA Guidelines § 15065(a)(4).

Public health risks related to construction work requires a mandatory finding of significance under CEQA. Construction work has been defined as a Lower to High-risk activity for COVID-19 spread by the Occupations Safety and Health Administration. Recently, several construction sites have been identified as sources of community spread of COVID-19.[3]

SWRCC recommends that the Lead Agency adopt additional CEQA mitigation measures to mitigate public health risks from the Project's construction activities. SWRCC requests that the Lead Agency require safe on-site construction work practices as well as training and certification for any construction workers on the Project Site.

In particular, based upon SWRCC's experience with safe construction site work practices, SWRCC recommends that the Lead Agency require that while construction activities are being conducted at the Project Site:

Construction Site Design:

- The Project Site will be limited to two controlled entry points.
- Entry points will have temperature screening technicians taking temperature readings when the entry point is open.
- The Temperature Screening Site Plan shows details regarding access to the Project Site and Project Site logistics for conducting temperature screening.
- A 48-hour advance notice will be provided to all trades prior to the first day of temperature screening.

1-14

[3] Santa Clara County Public Health (June 12, 2020) COVID-19 CASES AT CONSTRUCTION SITES HIGHLIGHT NEED FOR CONTINUED VIGILANCE IN SECTORS THAT HAVE REOPENED, *available at* https://www.sccgov.org/sites/covid19/Pages/press-release-06-12-2020-cases-at-construction-sites.aspx.

- The perimeter fence directly adjacent to the entry points will be clearly marked indicating the appropriate 6-foot social distancing position for when you approach the screening area. Please reference the Apex temperature screening site map for additional details.
- There will be clear signage posted at the project site directing you through temperature screening.
- Provide hand washing stations throughout the construction site.

Testing Procedures:

- The temperature screening being used are non-contact devices.
- Temperature readings will not be recorded.
- Personnel will be screened upon entering the testing center and should only take 1-2 seconds per individual.
- Hard hats, head coverings, sweat, dirt, sunscreen or any other cosmetics must be removed on the forehead before temperature screening.
- Anyone who refuses to submit to a temperature screening or does not answer the health screening questions will be refused access to the Project Site.
- Screening will be performed at both entrances from 5:30 am to 7:30 am.; main gate [ZONE 1] and personnel gate [ZONE 2]
- After 7:30 am only the main gate entrance [ZONE 1] will continue to be used for temperature testing for anybody gaining entry to the project site such as returning personnel, deliveries, and visitors.
- If the digital thermometer displays a temperature reading above 100.0 degrees Fahrenheit, a second reading will be taken to verify an accurate reading.

1-14 Cont.

- If the second reading confirms an elevated temperature, DHS will instruct the individual that he/she will not be allowed to enter the Project Site. DHS will also instruct the individual to promptly notify his/her supervisor and his/her human resources (HR) representative and provide them with a copy of Annex A.

Planning

- Require the development of an Infectious Disease Preparedness and Response Plan that will include basic infection prevention measures (requiring the use of personal protection equipment), policies and procedures for prompt identification and isolation of sick individuals, social distancing (prohibiting gatherings of no more than 10 people including all-hands meetings and all-hands lunches) communication and training and workplace controls that meet standards that may be promulgated by the Center for Disease Control, Occupational Safety and Health Administration, Cal/OSHA, California Department of Public Health or applicable local public health agencies.[4]

1-14 Cont.

The United Brotherhood of Carpenters and Carpenters International Training Fund has developed COVID-19 Training and Certification to ensure that Carpenter union members and apprentices conduct safe work practices. The Agency should require that all construction workers undergo COVID-19 Training and Certification before being allowed to conduct construction activities at the Project Site.

D. The DEIR's Mitigation Measures are Impermissibly Vague and Defer Critical Details

1-15

The DEIR improperly defers critical details of mitigation measures. Feasible mitigation measures for significant environmental effects must be set forth in an EIR for

[4] *See also* The Center for Construction Research and Training, North America's Building Trades Unions (April 27 2020) NABTU and CPWR COVIC-19 Standards for U.S Constructions Sites, *available at* https://www.cpwr.com/sites/default/files/NABTU_CPWR_Standards_COVID-19.pdf; Los Angeles County Department of Public Works (2020) Guidelines for Construction Sites During COVID-19 Pandemic, *available at* https://dpw.lacounty.gov/building-and-safety/docs/pw_guidelines-construction-sites.pdf.

consideration by the lead agency's decision makers and the public before certification of the EIR and approval of a project. The formulation of mitigation measures generally cannot be deferred until after certification of the EIR and approval of a project. CEQA Guidelines § 15126.4(a)(1)(B) ("…[f]ormulation of mitigation measures should not be deferred until some future time.").

Deferring critical details of mitigation measures undermines CEQA's purpose as a public information and decision-making statute. "[R]eliance on tentative plans for future mitigation after completion of the CEQA process significantly undermines CEQA's goals of full disclosure and informed decisionmaking; and[,] consequently, these mitigation plans have been overturned on judicial review as constituting improper deferral of environmental assessment." *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal. App. 4th 70, 92 ("*Communities*"). As the Court noted in *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 307, "[a] study conducted after approval of a project will inevitably have a diminished influence on decision-making. Even if the study is subject to administrative approval, it is analogous to the sort of post hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA."

A lead agency's adoption of an EIR's proposed mitigation measure for a significant environmental effect that merely states a "generalized goal" to mitigate a significant effect without committing to any specific criteria or standard of performance violates CEQA by improperly deferring the formulation and adoption of enforceable mitigation measures. *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 670; *Communities*, 184 Cal.App.4th at 93 ("EIR merely proposes a generalized goal of no net increase in greenhouse gas emissions and then sets out a handful of cursorily described mitigation measures for future consideration that might serve to mitigate the [project's significant environmental effects."); cf. *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1028-1029 (upheld EIR that set forth a range of mitigation measures to offset significant traffic impacts where performance criteria would have to be met, even though further study was needed and EIR did not specify which measures had to be adopted by city).].

The following Project mitigation measures are impermissibly vague and defer critical details:

- MM-CUL-1: Calls for development, but does not include details, of a Worker Environmental

1-15 Cont.

Awareness Program (WEAP) in order to address impacts to archeological resources;

- MM-GEO-1: Calls for a paleontologist to prepare a Paleontolgoical Resources Impact Mitigation Program (PRIMP) to mitigate unique paleontological resources but does not include any details of the PRIMP for review;
- MM-HAZ-1: Calls for incorporation of "abatement procedures" to remove asbestos, lead, etc. but does not include any specific performance standards for removal and does not include any plan in the DEIR for review; and
- MM-HAZ-2: Calls for development of a Hazardous Materials Contingency Plan (HMCP) to address potential impacts relating to soil and vapor intrusion with the 76 gas station adjacent to PCC-North, but again, fails to include any plan or any performance standards by which soil vapor would be mitigated to less than significant levels.

1-15 Cont.

(DEIR, ES-10~16.)

E. The DEIR Fails to Support Its Findings with Substantial Evidence

When new information is brought to light showing that an impact previously discussed in the DEIR but found to be insignificant with or without mitigation in the DEIR's analysis has the potential for a significant environmental impact supported by substantial evidence, the EIR must consider and resolve the conflict in the evidence. See *Visalia Retail, L.P. v. City of Visalia* (2018) 20 Cal. App. 5th 1, 13, 17; see also *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal. App. 4th 1099, 1109. While a lead agency has discretion to formulate standards for determining significance and the need for mitigation measures—the choice of any standards or thresholds of significance must be "based to the extent possible on scientific and factual data and an exercise of reasoned judgment based on substantial evidence. CEQA Guidelines § 15064(b); *Cleveland Nat'l Forest Found. v. San Diego Ass'n of Gov'ts* (2017) 3 Cal. App. 5th 497, 515; *Mission Bay Alliance v. Office of Community Inv. & Infrastructure* (2016) 6 Cal. App. 5th 160, 206. And when there is evidence that an

1-16

impact could be significant, an EIR cannot adopt a contrary finding without providing an adequate explanation along with supporting evidence. *East Sacramento Partnership for a Livable City v. City of Sacramento* (2016) 5 Cal. App. 5th 281, 302.

In addition, a determination that regulatory compliance will be sufficient to prevent significant adverse impacts must be based on a project-specific analysis of potential impacts and the effect of regulatory compliance. In *Californians for Alternatives to Toxics v. Department of Food & Agric.* (2005) 136 Cal. App. 4th 1, the court set aside an EIR for a statewide crop disease control plan because it did not include an evaluation of the risks to the environment and human health from the proposed program but simply presumed that no adverse impacts would occur from use of pesticides in accordance with the registration and labeling program of the California Department of Pesticide Regulation. *See also Ebbetts Pass Forest Watch v Department of Forestry & Fire Protection* (2008) 43 Cal. App. 4th 936, 956 (fact that Department of Pesticide Regulation had assessed environmental effects of certain herbicides in general did not excuse failure to assess effects of their use for specific timber harvesting project).

1-16 Cont.

1. *The DEIR Fails to Support its Findings on Greenhouse Gas Impacts with Substantial Evidence.*

CEQA Guidelines § 15064.4 allow a lead agency to determine the significance of a project's GHG impact via a qualitative analysis (e.g., extent to which a project complies with regulations or requirements of state/regional/local GHG plans), and/or a quantitative analysis (e.g., using model or methodology to estimate project emissions and compare it to a numeric threshold). So too, CEQA Guidelines allow lead agencies to select what model or methodology to estimate GHG emissions so long as the selection is supported with substantial evidence, and the lead agency "should explain the limitations of the particular model or methodology selected for use." CEQA Guidelines § 15064.4(c).

CEQA Guidelines sections 15064.4(b)(3) and 15183.5(b) allow a lead agency to consider a project's consistency with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

CEQA Guidelines §§ 15064.4(b)(3) and 15183.5(b)(1) make clear qualified GHG reduction plans or CAPs should include the following features:

1-17

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);

(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;

(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;

(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;

(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels;

1-17 Cont.

Collectively, the above-listed CAP features tie qualitative measures to quantitative results, which in turn become binding via proper monitoring and enforcement by the jurisdiction—all resulting in real GHG reductions for the jurisdiction as a whole, and the substantial evidence that the incremental contribution of an individual project is not cumulatively considerable.

Here, the DEIR's analysis of greenhouse gas emissions impacts is not supported by substantial evidence for all of the reasons outlined in SWAPE's April 12, 2021 letter regarding their review of the DEIR[5]:

- The DEIR utilized an incorrect and unsubstantiated quantitative analysis of emissions;
- The DEIR incorrectly relied upon an outdated quantitative GHG threshold;

[5] April 12, 2021 SWAPE Letter to Greg Sonstein re Comments on Pacific Coast Commons Specific Plan Project. Attached hereto as Exhibit D.

- The DEIR failed to identify a potentially significant GHG impact; and
- The DEIR failed to consider performance-based standards under CARB's 2017 Scoping Plan, and failed to consider performance-based standards under SCAG's RTP/SCS plan.

1-17 Cont.

(Exhibit D, 20-27.)

Additionally, the DEIR needs to consider and incorporate all of the feasible mitigation measures to reduce identified GHG impacts proposed by SWAPE. (Exhibit D, 27-34.)

2. *The DEIR Fails to Support its Findings on Air Quality Impacts with Substantial Evidence.*

Second, the DEIR's Air Quality analysis is fundamentally flawed and not supported by substantial evidence for all the reasons outlined in SWAPE's comments, including:

- Use of unsubstantiated input parameters to estimate project emissions,
  - Underestimated land use sizes;
  - Failure to model all required demolition;
  - Unsubstantiated changed to acres of grading values;
  - Unsubstantiated changes to material silt content values;
  - Unsubstantiated change to hauling trip numbers;
  - Unsubstantiated changes to architectural and area coating areas;
  - Underestimated operational vehicle trip rates;
  - Unsubstantiated changes to energy use values;
  - Unsubstantiated changes to wastewater treatment system percentages;
  - Incorrect application of construction-related mitigation measures;
  - Incorrect application of mobile-related operational mitigation measures; and
  - Failing to adequately analyze diesel particulate matter health risk emissions and identify a potentially significant health risk impact.

1-18

(Exhibit D, 1-19.)

Additionally, as noted above, the DEIR fails to consider or include many feasible mitigation measures proposed by SWAPE to reduce significant air quality impacts.

(DEIR, 27-34.) The DEIR needs to be revised and recirculated with a substantiated air quality analysis that includes all feasible mitigation measures to reduce impacts. 1-18 Cont.

3. *The DEIR Fails to Support its Findings on Transportation Impacts with Substantial Evidence.*

CEQA Guidelines § 15064.3(b) requires analysis of a Project's vehicle miles traveled (VMT) impacts as part of the environmental document's transportation impacts analysis. According to the DEIR, the OPR technical guidance suggests that projects which have a VMT per capita of 15% or more below existing conditions may indicate a less than significant transportation impact relating to VMT. (DEIR, 4.13-21~2.) Assuming then this is the proper methodology, the DEIR concludes that the Project would have a less than significant VMT impact because the project is predicted to exhibit more than a 15% reduction in VMT over VMT per capita for the City as a whole, and the region. (DEIR, 4.13-22.)

The DEIR estimates a VMT per capita of 10.9 based upon the project site's location within TAZ (transportation analysis zone) 21125100—yet, it is not clear that this VMT estimate accounts for trips other than home-based VMT which is traced back to residences.[6] Home-based VMT excludes work trips and other trips not originating from residences in the Project area. Thus, the TAZ estimate is not an accurate reflection of actual (or total) VMT per capita for the TAZ cannot be relied upon to determine VMT impact significance. A home-based VMT analysis is even less supported in the case of a project that includes mixed-use development, as here, such as a hotel and retail uses where home-based VMT estimates will not accurately reflect total VMT. 1-19

The DEIR should be revised and recirculated with a transportation analysis that includes total VMT estimates.

4. *The DEIR Fails to Support its Findings on Hazards and Hazardous Materials Impacts with Substantial Evidence.*

Appendix F of the DEIR (Phase I ESA) identifies numerous potentially hazardous waste sites in and around the Project site. Though some of these sites have received regulatory closure, the DEIR identifies at least one site "which could impact the 1-20

[6] *See, e.g., Transportation Analysis Updates in Santa Clarita* (May 19, 2020), prepared for City of Santa Clarita by Fehr & Peers, p. 15. Available at https://www.santa-clarita.com/Home/ShowDocument?id=18536.

Project site." (DEIR, 4.7-4.) The DEIR also identifies at least three other hazardous material release sites but postulates they would "not likely impact the environmental condition of the Project site. (*Id.*) Additionally, numerous UST violations were identified near the Project site; a gas station has been under ongoing operations since the 1930s which also includes environmental hazard violations for releases of petroleum products; and other multiple sources of PCE and TCE contamination were identified in the Project site area relating to manufacturing operations. (DEIR, 4.7-5.)

Despite all this evidence of potential hazardous substances release and a Phase I ESA of the site or area, the DEIR concludes that there would be no long-term operational impacts involving the release of hazardous materials. (DEIR, 4.7-21.) The City simply cannot rule out a risk to future Project site occupants from release of hazardous materials from all of these known sources without a Phase II ESA. The DEIR admits that ongoing operations of the former 76 gas station indicate a potential for release of hazardous substances, and many sources of PCE and TCE are present in the area that may require mitigation that have not been characterized at the site. This information does not support a conclusion of a less than significant impact without further studies. The DEIR should be revised and recirculated to include a Phase II ESA of the Project site that includes the surrounding area to adequately analyze whether there are potential impacts that may require mitigation.

1-20 Cont.

F. The Project Objectives are Unduly Narrow

Project objectives should not be so narrowly defined that they preclude consideration of reasonable alternatives for achieving the project's underlying purpose. *North Coast Rivers Alliance v Kawamura* (2015) 243 Cal. App. 4th 647, 668. Inconsistency with only some project objectives may not be an appropriate basis to eliminate impact-reducing project alternatives from analysis in an EIR. See CEQA Guidelines § 15126.6(c), (f). The fact that a proposed alternative does not meet all of the Project Objectives is not an appropriate basis to eliminate impact-reducing alternatives from analysis in an EIR. CEQA Guidelines § 15126.6(c), (f). Objectives should be based on the underlying purpose of the project, rather than the specific nature of the proposed project. *Habitat & Watershed Caretakers v City of Santa Cruz* (2013) 213 Cal. App. 4th 1277, 1299 (holding that the project objective of implementing a settlement agreement relating to expansion of a University of California campus was too narrow and too focused on the nature of the Project).

1-21

Here, the EIR provides extremely narrow and specific objectives that essentially only describe the proposed Project, rather than the purpose of the project:

- Objective 1 calls for maintaining existing hotel uses; and
- Objective 5 calls for increasing the efficient use of land by eliminating surface parking lots and providing parking garages that allow for sharing among hotel commercial, and residential land uses.

(DEIR, 3-18.)

Effectively, the above Project objectives so narrowly define the scope of the Project that it curtails any meaningful analysis or consideration of Project alternatives that could substantially reduce the Project's environmental impacts. A revised and recirculated DEIR should include amended Project objectives that do not circumscribe the EIR's Alternatives' analysis.

1-21 Cont.

III. THE PROJECT VIOLATES THE STATE PLANNING AND ZONING LAW AS WELL AS THE CITY'S GENERAL PLAN

A. Background Regarding the State Planning and Zoning Law

Each California city and county must adopt a comprehensive, long-term general plan governing development. *Napa Citizens for Honest Gov. v. Napa County Bd. of Supervisors* (2001) 91 Cal. App.4th 342, 352, citing Gov. Code §§ 65030, 65300. The general plan sits at the top of the land use planning hierarchy (See *DeVita v. County of Napa* (1995) 9 Cal. App. 4th 763, 773), and serves as a "constitution" or "charter" for all future development. *Lesher Communications, Inc. v. City of Walnut Creek* (1990) 52 Cal. App. 3d 531, 540.

General plan consistency is "the linchpin of California's land use and development laws; it is the principle which infused the concept of planned growth with the force of law." See *Debottari v. Norco City Council* (1985) 171 Cal. App. 3d 1204, 1213.

State law mandates two levels of consistency. First, a general plan must be internally or "horizontally" consistent: its elements must "comprise an integrated, internally consistent and compatible statement of policies for the adopting agency." (See Gov. Code § 65300.5; *Sierra Club v. Bd. of Supervisors* (1981) 126 Cal. App. 3d 698, 704.) A general plan amendment thus may not be internally inconsistent, nor may it cause the general plan as a whole to become internally inconsistent. See *DeVita*, 9 Cal. App. 4th at 796 fn. 12.

1-22

Second, state law requires "vertical" consistency, meaning that zoning ordinances and other land use decisions also must be consistent with the general plan. (See Gov. Code § 65860(a)(2) [land uses authorized by zoning ordinance must be "compatible with the objectives, policies, general land uses, and programs specified in the [general] plan."]; see also *Neighborhood Action Group v. County of Calaveras* (1984) 156 Cal. App. 3d 1176, 1184.) A zoning ordinance that conflicts with the general plan or impedes achievement of its policies is invalid and cannot be given effect. See *Lesher*, 52 Cal. App. 3d at 544.

State law requires that all subordinate land use decisions, including conditional use permits, be consistent with the general plan. See Gov. Code § 65860(a)(2); *Neighborhood Action Group*, 156 Cal. App. 3d at 1184.

A project cannot be found consistent with a general plan if it conflicts with a general plan policy that is "fundamental, mandatory, and clear," regardless of whether it is consistent with other general plan policies. See *Endangered Habitats League v. County of Orange* (2005) 131 Cal. App. 4th 777, 782-83; *Families Unafraid to Uphold Rural El Dorado County v. Bd. of Supervisors* (1998) 62 Cal. App. 4th 1332, 1341-42 ("*FUTURE*").

Moreover, even in the absence of such a direct conflict, an ordinance or development project may not be approved if it interferes with or frustrates the general plan's policies and objectives. See *Napa Citizens*, 91 Cal. App. 4th at 378-79; see also *Lesher*, 52 Cal. App. 3d at 544 (zoning ordinance restricting development conflicted with growth-oriented policies of general plan).

1-22 Cont.

B. The DEIR Fails to Demonstrate Consistency with SCAG's RTP/SCS Plan

Senate Bill No. 375 requires regional planning agencies to include a sustainable communities strategy in their regional transportation plans. Gov. Code § 65080, sub.(b)(2)(B).) CEQA Guidelines § 15125(d) provides that an EIR "shall discuss any inconsistencies between the proposed project and…regional plans. Such regional plans include…regional transportation plans." Thus, CEQA requires analysis of any inconsistencies between the Project and the relevant RTP/SCS plan.

In September 2008, SB 375 (Gov. Code § 65080(b) et seq.) was instituted to help achieve AB 32 goals through strategies including requiring regional agencies to prepare a Sustainable Communities Strategy ("SCS") to be incorporated into their Regional Transportation Plan ("RTP"). The RTP links land use planning with the regional

1-23

transportation system so that the region can grow smartly and sustainably, while also demonstrating how the region will meet targets set by CARB that reduce the per capita GHG emission from passenger vehicles in the region.

According to SWAPE's comments, the DEIR failed to consider performance-based standards under the RTP/SCS plan. The DEIR failed to evaluate whether the Project is consistent with per capita GHG emission targets, or daily vehicle miles traveled. (Ex. D, 24.) And according to SWAPE's analysis and conclusion, the Project exceeds both per capita GHG emissions targets and daily VMT per capita—thus, the Project is not consistent with SCAG's RTP/SCS Plan.

1-23 Cont.

C. The DEIR Fails to Demonstrate Consistency with the State Housing Law's Regional Housing Needs Assessment Requirements and the City's Obligations to Fulfill those Requirements in its Housing Element

State law requires that jurisdictions provide their fair share of regional housing needs and adopt a general plan for future growth (California Government Code Section 65300). The California Department of Housing and Community Development (HCD) is mandated to determine state-wide housing needs by income category for each Council of Governments (COG) throughout the state. The housing need is determined based on four broad household income categories: very low (households making less than 50 percent of median family income), low (50 to 80 percent of median family income), moderate (80 to 120 percent of median family income), and above moderate (more than 120 percent of median family income). The intent of the future needs allocation by income groups is to relieve the undue concentration of very low and low-income households in a single jurisdiction and to help allocate resources in a fair and equitable manner.

1-24

CEQA requires the DEIR analyze the Project's consistency with the State's housing goals. CEQA Guidelines section 15125(d) requires that an environmental impact report "discuss any inconsistencies between the proposed project and applicable general plans, specific plans and regional plans. *See also Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal. App. 5th 467, 543.

A Court "[w]hen reviewing whether a discussion is sufficient to satisfy CEQA, . . . the EIR (1) includes sufficient detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issues the proposed project raises [citation omitted], and (2) makes a reasonable effort to substantively

connect a project's air quality impacts to likely health consequences." (*Sierra Club v. County of Fresno* (2018) 6 Cal. 5th 502, 510 [citing *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405.]; see also PRC §§ 21002.1(e), 21003(b).) The Court may determine whether a CEQA environmental document sufficiently discloses information required by CEQA de novo as "noncompliance with the information disclosure provisions" of CEQA is a failure to proceed in a manner required by law. (PRC § 21005(a); see also *Sierra Club v. County of Fresno* (2018) 6 Cal. 5th 502, 515.)

SCAG is the COG for Los Angeles County and has determined that the City's RHNA for the 6th Cycle allocation period is 189 units for very low income residents, 88 units for low income residents, 84 units for moderate income residents, and 131 unit for above moderate income residents for a total of 492 housing units.[7]

First, the City fails to analyze consistency with the latest RHNA allocation in the DEIR. (DEIR, 4.11-6.) Second, the Project fails to include *any* affordable housing units as part of the Project for residents with income below above moderate. The City is required to meet the housing needs of all of city residents under the state housing law. While the DEIR calls for a provision in a future development agreement to include some affordable housing units, at this stage of the Project, none are included and no development agreement has been drafted.

The DEIR should be revised and recirculated with an affordable housing component.

1-24 Cont.

IV. CONCLUSION

Commenters request that the City deny the Project's proposed Site Plan Review and any other discretionary approvals the City finds necessary and order the revision and recirculation of the Project's environmental impact report to address the aforementioned concerns.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

1-26

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

"$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$

Where:

n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

"$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$

Where:

$\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant

VMT = vehicle miles traveled

$EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

1-26 Cont.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

2

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added).[12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

1-26 Cont.

Worker Trip Length by Air Basin		
Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	**16.47**	**11.17**
Minimum	**10.80**	**10.80**
Maximum	**19.80**	**14.70**
Range	**9.00**	**3.90**

[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

3

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

1-27 Cont.

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 – 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989 – 1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 - 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

1-27 Cont.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

1-27 Cont.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

1-27 Cont.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

1-27 Cont.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Subject: Comments on the Pacific Coast Commons Specific Plan (SCH No. 2020050508)

Dear Mr. Sonstein,

We have reviewed the February 2021 Draft Environmental Impact Report ("DEIR") for the Pacific Coast Commons Specific Plan ("Project") located in the City of El Segundo ("City"). The Project proposes to the adoption of a Specific Plan that would allow for the continued operation of 596 hotel rooms and construction of 263 housing units, 11,252-SF of commercial/retail uses, and 792 parking stalls on the 6.385-acre site.

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

1-28

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's air quality analysis relies on emissions calculated with CalEEMod.2016.3.2 (p. 4.2-1).[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes

1-29

[1] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.

be justified by substantial evidence. Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

When reviewing the Project's CalEEMod output files, provided in Appendix C-1, "CalEEMod Outputs," and Appendix C-2, "Health Risk Assessment Report," to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. As a result, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

1-29 Cont.

Underestimated Land Use Sizes

According to the DEIR, the Project proposes to construct 327,021-SF of residential development, 11,252-SF of commercial/retail uses, and 792 parking spaces (p. 3-2). However, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and "Pacific Coast Commons Specific Plan Project Mit" models include only 314,659-SF of residential space, 11,000-SF of commercial/retail space, and 763 parking spaces (see excerpt below) (Appendix C-1, pp. 3, 51, 95; Appendix C-2, pp. 33).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
Enclosed Parking with Elevator	763.00	Space	0.00	305,200.00
Other Asphalt Surfaces	12.65	1000sqft	0.00	12,650.00
High Turnover (Sit Down Restaurant)	3.70	1000sqft	0.00	3,700.00
Apartments Mid Rise	263.00	Dwelling Unit	0.00	314,659.00
Regional Shopping Center	7.30	1000sqft	5.35	7,300.00

1-30

As you can see in the excerpt above, the proposed residential, commercial/retail, and parking land uses are underestimated by 12,362-SF, 252-SF, and 29 spaces, respectively. These underestimations present an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[2] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Thus, by underestimating the sizes of the proposed residential, commercial/retail, and parking land uses, the models underestimate the Project's emissions and should not be relied upon to determine Project significance.

[2] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/01_user-39-s-guide2016-3-1.pdf?sfvrsn=2, p. 17

Failure to Model All Required Demolition

According to the CalEEMod User's Guide, "[h]aul trips are based on the amount of material that is demolished, imported or exported assuming a truck can handle 16 cubic yards of material."[3] Therefore, the air model calculates a default number of hauling trips based upon the amount of demolition material inputted into the model. According to the DEIR:

> "During Phase 1, it was assumed that *41,660-SF of buildings* and *6,000-SF of pavement* would require demolition. For Phases 2 and 3, it was assumed that a total of *131,000 square feet of pavement* would require demolition" (p. 4.2-25).

As such, the models should have included at least 178,660-SF of demolition.[4] When correctly inputting 178,660-SF of building demolition, the model calculates a default demolition hauling trip number of 812 trips. However, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include only 381 total default hauling trips, which were artificially increased to 400 hauling trips (see excerpts below) (Appendix C-1, pp. 13, 61, 105; Appendix C-2, pp. 42).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	189.00	200.00
tblTripsAndVMT	HaulingTripNumber	192.00	200.00

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number
Demolition - Phase 1	6	80.00	20.00	200.00
Site Preparation - Phase 1	7	50.00	10.00	0.00
Grading - Phase 1	6	80.00	10.00	0.00
Building Construction - Phase 1	9	120.00	30.00	0.00
Paving - Phase 1	6	40.00	10.00	0.00
Architectural Coating - Phase 1	1	80.00	20.00	0.00
Demolition - Phases 2 and 3	6	100.00	40.00	200.00
Site Preparation - Phases 2 and 3	7	120.00	20.00	0.00
Grading - Phases 2 and 3	6	160.00	20.00	1,720.00
Building Construction - Phases 2 and 3	9	300.00	60.00	0.00
Paving - Phases 2 and 3	6	80.00	20.00	0.00
Architectural Coating - Phases 2 and 3	1	240.00	40.00	0.00

1-31

[3] http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14

[4] Calculated: (41,660-SF of buildings demolition) + (6,000-SF of pavement demolition) + (131,000-SF of pavement demolition) = 178,660-SF of demolition.

3

As you can see in the excerpts above, the ***default*** number of demolition hauling trips was underestimated by 431 trips.[5] As such, the models fail to include the total amount of demolition required for the Project.

This underestimation presents an issue, as the total amount of demolition material is used by CalEEMod to determine emissions associated with this phase of construction; the three primary operations that generate dust emission during the demolition phase are mechanical or explosive dismemberment, site removal of debris, and on-site truck traffic on paved and unpaved road.[6] By failing to include the total amount of required demolition, the models underestimate emissions associated with fugitive dust, site removal, as well as exhaust from hauling trucks traveling to and from the site, and should not be relied upon to determine the significance of the Project's air quality impacts.

1-31 Cont.

Unsubstantiated Changes to Acres of Grading Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include reductions to the default acres of grading values (see excerpt below) (Appendix C-1, pp. 6, 54, 98; Appendix C-2, pp. 36).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	21.50	0.74
tblGrading	AcresOfGrading	21.00	3.14

As you can see in the excerpt above, the acres of grading values were reduced by approximately 97%, from the default value of 21.5- to 0.74-acres, and 85%, from the default value of 21- to 3.14-acres. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[7] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "17,000 CY of soil export during Phase 2" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34). Furthermore, regarding the acres of grading value, the DEIR states:

> "During grading activities, fugitive dust can be generated from the movement of dirt on the Project site. CalEEMod estimates dust from dozers moving dirt around, dust from graders or scrapers leveling the land, and loading or unloading dirt into haul trucks. Each of those activities is calculated differently in CalEEMod, ***based on the number of acres traversed by the grading equipment***" (emphasis) (p. 4.2-23).

1-32

However, these reductions remain unsupported for two reasons. First, the justification provided by the "User Entered Comments & Non-Default Data" table fails to address the revised acres of grading value. Second, according to the CalEEMod User's Guide:

> "[T]he dimensions (e.g., length and width) of the grading site have no impact on the calculation, only the total area to be graded. In order to properly grade a piece of land multiple passes with

[5] Calculated: (812 demolition hauling trips) – (381 trips demolition hauling trips) = 431 demolition hauling trips.
[6] CalEEMod User Guide, Appendix A, p. 11, *available at:* http://www.caleemod.com/
[7] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

equipment may be required. The acres is based on the equipment list and days in grading or site preparation phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday."[8]

Thus, as the dimensions of the Project site have no impact on the acres of grading value, and the DEIR fails to substantiate this change, we cannot verify the revised acres of grading values.

1-32 Cont.

These unsubstantiated reductions present an issue, as CalEEMod uses the acres of grading value to estimate the dust emissions associated with grading.[9] Thus, by including unsubstantiated reductions to the default acres of grading values, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Material Moisture Content Bulldozing Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include several changes to the default material moisture content bulldozing values (see excerpt below) (Appendix C-1, pp. 6, 54, 98; Appendix C-2, pp. 36).

Table Name	Column Name	Default Value	New Value
tblGrading	MaterialMoistureContentBulldozing	7.90	17.00
tblGrading	MaterialMoistureContentBulldozing	7.90	17.00
tblGrading	MaterialMoistureContentBulldozing	7.90	17.00

As you can see in the excerpt above, the material moisture content bulldozing values were increased from the default value of 7.9% to 17%. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[10] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "17,000 CY of soil export during Phase 2" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34).

1-33

However, this change remains unsupported for two reasons. First, the justification provided by the "User Entered Comments & Non-Default Data" table fails to address the revised material moisture content bulldozing values. Second, the DEIR and associated documents fail to mention or justify these changes whatsoever.

[8] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[9] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[10] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

These unsubstantiated changes present an issue, as CalEEMod uses the material moisture content bulldozing values to calculate the dust emission factor associated with bulldozing.[11] Specifically, CalEEMod utilizes the following equations:[12]

$$EF_{TSP} = \frac{C_{TSP} \times s^{1.2}}{M^{1.3}}, \text{ and } EF_{PM2.5} = EF_{TSP} \times F_{PM2.5}$$

$$EF_{PM15} = \frac{C_{PM15} \times s^{1.5}}{M^{1.4}}, \text{ and } EF_{PM10} = EF_{PM15} \times F_{PM10}$$

Where:
EF = emission factor (lb/hr)
C = arbitrary coefficient used by AP-42
M = material moisture content (%)
S = material silt content (%)
F = scaling factor

1-33 Cont.

As demonstrated above, there is an inverse relationship between material moisture content and dust emission factors. In other words, *when the material moisture content percentage increases, the dust emission factor decreases*. As such, by including unsubstantiated increases to the material moisture content values, the models may underestimate the emissions associated with bulldozing. Thus, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Material Silt Content Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include several reductions to the default material silt content values (see excerpt below) (Appendix C-1, pp. 6, 54, 98; Appendix C-2, pp. 36).

Table Name	Column Name	Default Value	New Value
tblGrading	MaterialSiltContent	6.90	3.30
tblGrading	MaterialSiltContent	6.90	3.30
tblGrading	MaterialSiltContent	6.90	3.30
tblGrading	MaterialSiltContent	6.90	3.30

1-34

As you can see in the excerpt above, the material silt content values were increased from the default value to 6.9% to 3.3%. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[13] According to the "User Entered Comments & Non-Default Data" table, the

[11] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.
[12] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.
[13] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

justification provided for these changes is: "17,000 CY of soil export during Phase 2" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34).

However, this change remains unsupported for two reasons. First, the justification provided by the "User Entered Comments & Non-Default Data" table fails to address the revised material silt content values. Second, the DEIR and associated documents fail to mention or justify these changes whatsoever.

These unsubstantiated changes present an issue, because CalEEMod uses the material silt content values to calculate the dust emission factor associated with bulldozing.[14] Specifically, CalEEMod utilizes the following equations:[15]

$$EF_{TSP} = \frac{C_{TSP} \times s^{1.2}}{M^{1.3}}, \text{ and } EF_{PM2.5} = EF_{TSP} \times F_{PM2.5}$$

$$EF_{PM15} = \frac{C_{PM15} \times s^{1.5}}{M^{1.4}}, \text{ and } EF_{PM10} = EF_{PM15} \times F_{PM10}$$

Where:
EF = emission factor (lb/hr)
C = arbitrary coefficient used by AP-42
M = material moisture content (%)
S = material silt content (%)
F = scaling factor

As demonstrated above, there is a direct relationship between material silt content and dust emission factors. In other words, *when the material silt content percentage decreases, the dust emission factor decreases as well*. As such, by including unsubstantiated increases to the material silt content values, the models may underestimate the emissions associated with bulldozing. Thus, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

1-34 Cont.

Unsubstantiated Changes to Hauling Trip Numbers

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes several changes to the default hauling trip numbers (see excerpt below) (Appendix C-1, pp. 6-7, 54, 98).

1-35

[14] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.
[15] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	189.00	200.00
tblTripsAndVMT	HaulingTripNumber	192.00	200.00
tblTripsAndVMT	HaulingTripNumber	2,125.00	1,720.00

As you can see in the excerpt above, the number of hauling trips was collectively reduced by 386 trips, from the cumulative default value of 2,506 trips to 2,120 trips.[16] As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[17] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Updated per applicant" (Appendix C-1, pp. 4, 52, 96). Furthermore, the DEIR states:

> "Haul truck trips during the demolition and grading phases were based on demolition and earthwork quantities provided" (p. 4.2-25).

1-35 Cont.

However, these justifications are insufficient, as the DEIR and associated documents fail to provide the calculations or explain how the revised hauling trip numbers were derived "based on demolition and earthwork quantities." As such, we cannot verify the revised hauling trip numbers.

These unsubstantiated changes present an issue, as CalEEMod uses number of hauling trips to estimate the construction-related emissions associated with on-road vehicles.[18] Thus, by including unsubstantiated changes to the default hauling trip numbers, the model may underestimate the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Architectural and Area Coating Areas

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and "Pacific Coast Commons Specific Plan Project Mit" models include several reductions to the default architectural and area coating areas (see excerpt below) (Appendix C-1, pp. 5, 52-53, 96-97; Appendix C-2, pp. 34-35).

Table Name	Column Name	Default Value	New Value
tblArchitecturalCoating	ConstArea_Residential_Exterior	212,395.00	0.00
tblArchitecturalCoating	ConstArea_Residential_Exterior	212,395.00	212,213.00
tblArchitecturalCoating	ConstArea_Residential_Interior	637,184.00	0.00
tblArchitecturalCoating	ConstArea_Residential_Interior	637,184.00	636,338.00
tblAreaCoating	Area_Parking	19071	1959

1-36

[16] Calculated: (189 + 192 + 2,125 default hauling trips) – (200 + 200 + 1,720 revised hauling trips) = 386 net decrease in hauling trips.
[17] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[18] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 34.

As you can see in the excerpt above, the architectural coating areas were reduced by 850,607-SF, from the cumulative default value of 1,699,158- to 848,551-SF;[19] and the area coating area for the proposed parking land use was reduced by 17,112-SF, from the default value of 19,701- to 1,959-SF.[20] As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[21] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Updated SF per phase" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34). However, these reductions remain unsupported for two reasons.

First, the DEIR and associated documents fail to mention or justify the changes to the construction-related architectural coating areas whatsoever. As such, we cannot verify the revised architectural coating areas.

Second, regarding the operational area coating areas, the DEIR states:

> "*Consistent with CalEEMod defaults*, it is assumed that the residential surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating. For nonresidential land uses (e.g., retail, community, and commercial areas), it is assumed that the surface area for painting equals 2.0 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating. *For the parking garage, the architectural coating area is assumed to be 6% of the total square footage, consistent with the supporting CalEEMod studies provided as an appendix to the CalEEMod User's Guide*" (emphasis added) (p. 4.2-28).

1-36 Cont.

As demonstrated above, the DEIR claims that the Project's area coating areas are consistent with CalEEMod defaults. Thus, as the area coating area was reduced from the default value, the change is unsubstantiated and inconsistent with the information provided in the DEIR. As such, we cannot verify the revised area coating area.

These unsubstantiated reductions present an issue, as CalEEMod uses architectural and area coating areas to calculate ROG emissions associated with painting and reapplication.[22] Thus, by including unsubstantiated reductions to the default architectural and area coating areas, the models may underestimate the Project's area-source emissions and should not be relied upon to determine Project significance.

[19] Calculated: (212,395-SF + 212,395-SF + 637,184-SF + 637,184-SF default architectural coating areas) – (212,213-SF + 636,338-SF revised architectural coating areas) = 850,607-SF net decrease in architectural coating areas.
[20] 19,70-SF default area coating area –1,959-SF revised area coating area = 17,112-SF net decrease inn area coating area.

[22] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 35, 42.

9

Underestimated Operational Vehicle Trip Rates

According to the Traffic Impact Analysis ("TIA"), provided in Appendix J-1 to the DEIR, the Project is expected to generate approximately 2,517 average daily vehicle trips (see excerpt below) (p. 30, Table 4).

Land Use	ITE Land Use Code	Size	Trip Generation Rates [a]							Daily
			Daily	AM Peak Hour			PM Peak Hour			
				Rate	In%	Out%	Rate	In%	Out%

1-37

As such, the models should have included trip rates that reflect the number of average daily operational vehicle trips estimated by the TIA. However, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes only 2,506.08 weekday and 2,271.19 Saturday vehicle trips (see excerpt below) (Appendix C-1, pp. 42, 90, 134).

Land Use	Average Daily Trip Rate		
	Weekday	Saturday	Sunday
Apartments Mid Rise	1,357.08	1,304.48	1196.65
Enclosed Parking with Elevator	0.00	0.00	0.00
High Turnover (Sit Down Restaurant)	887.00	1,104.78	919.71
Other Asphalt Surfaces	0.00	0.00	0.00
Regional Shopping Center	262.00	306.60	154.83
Total	2,506.08	2,715.86	2,271.19

As you can see in the excerpt above, the weekday and Sunday trip numbers are underestimated by approximately 11- and 246-trips, respectively. As such, the trip rates inputted into the proposed land use models are underestimated and inconsistent with the information provided by the TIA.

10

These inconsistencies present an issue, as CalEEMod uses the operational vehicle trip rates to calculate the emissions associated with the Project's operational on-road vehicles.[23] Thus, by including underestimated operational vehicle trip rates, the model underestimates the Project's mobile-source operational emissions and should not be relied upon to determine Project significance.

1-37 Cont.

Unsubstantiated Changes to Energy Use Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes several reductions to the default energy use values (see excerpt below) (Appendix C-1, pp. 5-6, 53, 97).

Table Name	Column Name	Default Value	New Value
tblEnergyUse	T24E	179.76	176.16
tblEnergyUse	T24E	3.92	3.50
tblEnergyUse	T24E	8.71	7.78
tblEnergyUse	T24E	2.93	2.62
tblEnergyUse	T24NG	5,911.46	5,615.89
tblEnergyUse	T24NG	78.56	77.77
tblEnergyUse	T24NG	0.95	0.94

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[24] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Assume compliance with 2019 Title 24 Standards" (Appendix C-1, pp. 4, 52, 96). Furthermore, regarding 2019 Title 24 Standards, the DEIR states:

> "CalEEMod assumes compliance with the 2016 Title 24 Building Energy Efficiency Standards. The default values were updated to reflect the more stringent 2019 Title 24 Building Energy Efficiency Standards, which became effective on January 1, 2020" (p. 4.2-28).

1-38

However, these justifications are insufficient. Simply because the 2019 Title 24 standards ***expect*** a reduction in building energy consumption does not ***guarantee*** that these reductions would be implemented locally on the Project site. Absent additional information demonstrating that these reductions would be achieved through the implementation, monitoring, and enforcement of energy-related mitigation measures, we are unable to verify the revised energy use values inputted into the model.

These unsubstantiated reductions present an issue, as CalEEMod uses the energy use values to calculate the Project's emissions associated with building electricity and non-hearth natural gas usage.[25] By including unsubstantiated changes to the default energy use values, the model may underestimate the Project's energy-source operational emissions and should not be relied upon to determine Project significance.

[23] "CalEEMod User Guide." CAPCOA, November 2017, *available at:* http://www.caleemod.com/, p. 35.
[24] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[25] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 43

Unsubstantiated Changes to Wastewater Treatment System Percentages

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes several manual changes to the default wastewater system percentages (see excerpt below) (Appendix C-1, pp. 8, 55-56, 99-100).

Table Name	Column Name	Default Value	New Value
tblWater	AerobicPercent	87.46	100.00
tblWater	AerobicPercent	87.46	100.00
tblWater	AerobicPercent	87.46	100.00
tblWater	AerobicPercent	87.46	100.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	SepticTankPercent	10.33	0.00
tblWater	SepticTankPercent	10.33	0.00
tblWater	SepticTankPercent	10.33	0.00
tblWater	SepticTankPercent	10.33	0.00

As you can see in the excerpt above, the model assumes that the Project's wastewater would be treated 100% aerobically. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[26] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Assume 100% aerobic" (Appendix C-1, pp. 4, 52, 96). However, these changes remain unsupported. According to the DEIR:

> "Water consumption estimates for both indoor and outdoor water use and *associated electricity consumption from water use and wastewater generation were estimated using default values in CalEEMod*" (p. 4.6-27).

As demonstrated above, the DEIR claims that the electricity consumption from wastewater generation was estimated using the CalEEMod default values. Thus, the changes to the wastewater treatment system percentages are unsubstantiated and inconsistent with the information provided in the DEIR. As such, we cannot verify the revised values.

These inconsistencies present an issue, as each type of wastewater treatment system is associated with different GHG emission factors, which are used by CalEEMod to calculate the Project's total GHG emissions.[27] Thus, by including unsubstantiated changes to the default wastewater treatment system percentages, the model may underestimate the Project's GHG emissions and should not be relied upon to determine Project significance.

1-39

[26] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[27] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 45.

Incorrect Application of Construction-Related Mitigation Measures

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes the following construction-related mitigation measures (see excerpt below) (Appendix C-1, pp. 14, 62, 106):

3.1 Mitigation Measures Construction

Replace Ground Cover
Water Exposed Area

Furthermore, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project Mit" model includes the following construction-related mitigation measure (see excerpt below) (Appendix C-2, pp. 43):

3.1 Mitigation Measures Construction

Water Exposed Area

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[28] According to the "User Entered Comments and Non-Default Data" table for the "Pacific Coast Commons Specific Plan Project" model, the justification provided for the inclusion of these measures is: "Water three times daily and replace ground cover" (Appendix C-1, pp. 4, 52, 96). However, no justification was provided by the "User Entered Comments and Non-Default Data" table for the "Pacific Coast Commons Specific Plan Project Mit" model. Furthermore, the DEIR states:

> "The proposed Project would be required to comply with SCAQMD Rule 403 to control dust emissions generated during the grading activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering of the active sites three times per day depending on weather conditions" (p. 4.2-34).

However, the inclusion of the above-mentioned construction-related mitigation measures remains unsupported. Simply because the DEIR states that the Project would comply with SCAQMD Rule 403 does not justify the inclusion of the above-mentioned construction-related mitigation measures in the models. According to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on mitigation measures:

> "By definition, *mitigation measures are not part of the original project design*. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the

1-40

[28] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9.

13

project has undergone environmental review and are *above-and-beyond existing laws, regulations, and requirements* that would reduce environmental impacts" (emphasis added).[29]

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on the Project's compliance with SCAQMD Rule 403, is unsubstantiated. By including construction-related mitigation measures without properly committing to their implementation, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

1-40 Cont.

Incorrect Application of Mobile-Related Operational Mitigation Measures

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes the following mobile-, water-, and waste-related operational mitigation measures (see excerpt below) (Appendix C-1, pp. 42, 47, 49, 90, 134):

Mobile-Related:

4.1 Mitigation Measures Mobile

Improve Destination Accessibility
Increase Transit Accessibility
Improve Pedestrian Network

Water-Related:

7.1 Mitigation Measures Water

Apply Water Conservation Strategy

Waste-Related:

8.1 Mitigation Measures Waste

Institute Recycling and Composting Services

1-41

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[30] According to the "User Entered Comments and Non-Default Data" table, the justifications provided for the inclusion of the mobile-, water-, and waste-related measures are: "Increase transit accessibility (0.2 miles) and improve pedestrian network," "Reduce water consumption by 20% per CalGreen," and "Assume 50% waste disposed per AB 939" (Appendix C-1, pp. 4, 52, 96). However, the inclusion of these operational mitigation measures remains unsupported for three reasons.

[29] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 5.
[30] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9.

First, the DEIR fails to mention or justify the inclusion of the above-mentioned operational mitigation measures.

Second, the inclusion of these operational mitigation measures, based on the Project's compliance with existing policies and regulations, is unsupported. As previously stated, according to the AEP *CEQA Portal Topic Paper* on mitigation measures:

> "By definition, *mitigation measures are not part of the original project design*. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are *above-and-beyond existing laws, regulations, and requirements* that would reduce environmental impacts" (emphasis added).[31]

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on the Project's compliance with existing policies and regulations, is unsubstantiated.

Third, AEP guidance states:

> "While not "mitigation", a good practice is *to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP)*. Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, *it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact*" (emphasis added).[32]

As you can see in the excerpts above, design features that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the above-mentioned mobile-, water-, and waste-related operational measures are not formally included as mitigation measures, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site. As a result, the inclusion of the above-mentioned operational mitigation measures in the model is incorrect. By including several operational mitigation measures without properly committing to their implementation, the model may underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

1-41 Cont.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR concludes that the proposed Project would result in a less-than-significant health risk impact based on a quantified construction health risk analysis ("HRA"). Specifically, the DEIR estimates that

1-42

[31] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 5.
[32] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.

Project construction would result in a mitigated excess cancer risk of 4.23 in one million, which would not exceed the threshold of 10 in one million (see excerpt below) (p. 4.2-38, Table 4.2-13).

Table 4.2-13. Summary of Maximum Cancer and Chronic Health Risks - Mitigated

Impact Analysis	Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Maximally Exposed Individual Resident					
Construction HRA	Cancer Risk	Per Million	4.23	10	Less than Significant
	Chronic Hazard Index	Index Value	0.002	1.0	Less than Significant

Source: See Appendix C-2 for complete results.
Notes: CEQA = California Environmental Quality Act; HRA = Health Risk Assessment

However, the DEIR's evaluation of the Project's potential health risk impacts, as well as the less-than-significant impact conclusion, is incorrect for three reasons.

First, the DEIR's construction HRA is incorrect, as it relies upon an exhaust PM_{10} estimate from a flawed air model (Appendix C-2, p. 9). As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the CalEEMod Outputs as Appendix C-1 and the HRA Report as Appendix C-2 to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR and associated documents. As a result, the construction HRA utilizes an underestimated diesel particulate matter ("DPM") concentration to calculate the cancer risk associated with Project construction. As such, the DEIR underestimates the Project's construction-related cancer risk and should not be relied upon to determine Project significance.

Second, the DEIR fails to evaluate the Project's operational toxic air contaminants ("TACs") and associated health risk impacts. This is incorrect, as the TIA indicates that the proposed land uses are expected to generate approximately 2,517 average daily vehicle trips, which will generate additional exhaust emissions and continue to expose nearby sensitive receptors to DPM emissions (p. 30, Table 4). The DEIR fails to discuss the potential TACs associated with Project operation or indicate the concentrations at which such pollutants would trigger adverse health effects. Without making a reasonable effort to connect the Project's operational TAC emissions to the potential health risks posed to nearby receptors, the DEIR is inconsistent with CEQA's requirement to correlate the increase in emissions generated by the Project with the potential adverse impacts on human health.

Third, the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015, as referenced by HRA Report (Appendix C-2, p. 7).[33] The OEHHA document recommends that exposure from projects lasting more than 6 months be evaluated for the duration of the project and recommends that an exposure duration of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident ("MEIR").[34] Even though we were not provided with the expected lifetime of

1-42 Cont.

[33] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* http://oehha.ca.gov/air/hot_spots/hotspots2015.html
[34] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* http://oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf, p. 8-6, 8-15

the Project, we can reasonably assume that the Project will operate for at least 30 years, if not more. Therefore, we recommend that health risk impacts from Project operation also be evaluated, as a 30-year exposure duration vastly exceeds the 6-month requirement set forth by OEHHA. This recommendation reflects the most recent state health risk policies, and as such, we recommend that an analysis of health risk impacts posed to nearby sensitive receptors from Project operation be included in an updated EIR for the Project.

Fourth, while the DEIR includes an HRA evaluating the potential health risk impacts posed by Project construction to nearby, existing receptors, the HRA fails to evaluate the ***cumulative*** lifetime cancer risk to nearby, existing receptors as a result of all phases of Project ***construction and operation together***. According to OEHHA guidance, as referenced by the HRA Report, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location" (Appendix C-2, p. 7).[35] However, the DEIR's HRA fails to sum each age bin to evaluate the total cancer risk over the course of Project construction and operation. This is incorrect and, thus, an updated EIR should be prepared to quantify the cumulative excess cancer risk posed by Project construction and operation to nearby, existing receptors, and compare it to the SCAQMD threshold of 10 in one million.

Screening-Level Assessment Indicates a Potentially Significant Health Risk Impact

In order to conduct our screening-level risk assessment we relied upon AERSCREEN, which is a screening level air quality dispersion model.[36] The model replaced SCREEN3, and AERSCREEN is included in the OEHHA[37] and the California Air Pollution Control Officers Associated (CAPCOA)[38] guidance as the appropriate air dispersion model for Level 2 health risk screening assessments ("HRSAs"). A Level 2 HRSA utilizes a limited amount of site-specific information to generate maximum reasonable downwind concentrations of air contaminants to which nearby sensitive receptors may be exposed. If an unacceptable air quality hazard is determined to be possible using AERSCREEN, a more refined modeling approach is required prior to approval of the Project.

We prepared a preliminary HRA of the Project's operational health risk impact to sensitive receptors using the annual PM_{10} exhaust estimates from the DEIR's annual CalEEMod output files, consistent with the HRA Report's methodology (Appendix C-2, p. 9). Consistent with recommendations set forth by OEHHA, we used a residential exposure duration of 30 years, starting from the 3rd trimester stage of life. Subtracting the 1,034-day construction period from the total residential duration of 30 years, we assumed that after Project construction, the sensitive receptor would be exposed to the Project's operational DPM for an additional 27.17 years, approximately. The DEIR's CalEEMod model indicates that operational activities will generate approximately 87 pounds of DPM per year of operation. The AERSCREEN model relies on a continuous average emission rate to simulate maximum downward

1-42 Cont.

[38] CAPCOA (July 2009) Health Risk Assessments for Proposed Land Use Projects, http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA_HRA_LU_Guidelines_8-6-09.pdf.

17

concentrations from point, area, and volume emission sources. To account for the variability in equipment usage and truck trips over Project operation, we calculated an average DPM emission rate by the following equation.

$$Emission\ Rate\ \left(\frac{grams}{second}\right) = \frac{87.4\ lbs}{365\ days} \times \frac{453.6\ grams}{lbs} \times \frac{1\ day}{24\ hours} \times \frac{1\ hour}{3{,}600\ seconds} = \mathbf{0.00126\ g/s}$$

Using this equation, we estimated an operational emission rate of 0.00126 g/s. Operation was simulated as a 6.39-acre rectangular area source in AERSCREEN, with dimensions of 256 meters by 101 meters. A release height of three meters was selected to represent the height of stacks of operational equipment and other heavy-duty vehicles, and an initial vertical dimension of one and a half meters was used to simulate instantaneous plume dispersion upon release. An urban meteorological setting was selected with model-default inputs for wind speed and direction distribution.

The AERSCREEN model generates maximum reasonable estimates of single-hour DPM concentrations from the Project Site. EPA guidance suggests that in screening procedures, the annualized average concentration of an air pollutant to be estimated by multiplying the single-hour concentration by 10%.[39] According to the HRA Report, the closest residential receptors are located 25 feet west of the Project site (Appendix C-2, p. 1). However, review of the AERSCREEN output files demonstrates that the *maximally* exposed receptor is located approximately 125 meters from the Project site. Thus, for Project operation, the single-hour concentration at the MEIR estimated by AERSCREEN is approximately 1.937µg/m^3 DPM at approximately 125 meters downwind. Multiplying this single-hour concentration by 10%, we get an annualized average concentration of 0.1937 µg/m^3 for Project operation at the MEIR.

We calculated the excess cancer risk to the MEIR using applicable HRA methodologies prescribed by OEHHA. Consistent with the construction period of 1,034 days inputted into the DEIR's CalEEMod model, the annualized average concentration for Project operation was used for the remaining 13.42 years of the child stage of life (2 - 16 years) and the entire adult stage of life (16 – 30 years).

Consistent with the HRA Report's methodology, we used Age Sensitivity Factors ("ASFs") to account for the heightened susceptibility of young children to the carcinogenic toxicity of air pollution (Appendix C-2, p. 7). When applying ASFs, the quantified cancer risk should be multiplied by a factor of ten during the third trimester of pregnancy and during the first two years of life (infant), as well as multiplied by a factor of three during the child stage of life (2 – 16 years). Furthermore, in accordance with the guidance set forth by OEHHA, we used the 95th percentile breathing rates for infants.[40] Finally, according to SCAQMD guidance, we used a Fraction of Time At Home ("FAH") Value of 1 for the 3rd trimester and

1-42 Cont.

[39] U.S. EPA (October 1992) Screening Procedures for Estimating the Air Quality Impact of Stationary Sources Revised, http://www.epa.gov/ttn/scram/guidance/guide/EPA-454R-92-019_OCR.pdf.

[40] "Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics 'Hot Spots' Information and Assessment Act," July 2018, *available at:* http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab2588supplementalguidelines.pdf, p. 16.
"Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf

infant receptors.[41] We used a cancer potency factor of 1.1 (mg/kg-day)$^{-1}$ and an averaging time of 25,550 days. The results of our calculations are shown below.

The Maximum Exposed Individual at an Existing Residential Receptor (MEIR)

Activity	Duration (years)	Concentration (ug/m3)	Breathing Rate (L/kg-day)	ASF	Cancer Risk with ASFs*
Total Construction	**2.83**				**4.2E-06**
Operation	13.42	0.1937	572	3	6.7E-05
Child Exposure Duration	***13.42***			***Child Exposure***	***6.7E-05***
Operation	14.00	0.1937	261	1	7.8E-06
Adult Exposure Duration	***14.00***			***Adult Exposure***	***7.8E-06***
Lifetime Exposure Duration	**30.25**			**Lifetime Exposure**	**7.9E-05**

As demonstrated in the table above, the excess cancer risk to adults and children at the MEIR located approximately 125 meters away, over the course of Project operation, utilizing ASFs, are approximately 7.8 and 67 in one million, respectively. When summing the Project's estimated operational cancer risks, as estimated by SWAPE, with the DEIR's purported construction-related cancer risk of 4.23 in one million, we estimate a lifetime excess cancer risk of approximately 79 in one million (p. 18). Thus, the child and lifetime cancer risks exceed the SCAQMD threshold of 10 in one million, resulting in a potentially significant impact not previously addressed or identified by the DEIR.

An agency must include an analysis of health risks that connects the Project's air emissions with the health risk posed by those emissions. Our analysis represents a screening-level HRA, which is known to be conservative and tends to err on the side of health protection. The purpose of the screening-level construction and operational HRA shown above is to demonstrate the link between the proposed Project's emissions and the potential health risk. Our screening-level HRA demonstrates that construction and operation of the Project could result in a potentially significant health risk impact, when correct exposure assumptions and up-to-date, applicable guidance are used. Therefore, since our screening-level construction HRA indicates a potentially significant impact, an updated EIR should include a reasonable effort to connect the Project's air quality emissions and the potential health risks posed to nearby receptors. Thus, an updated EIR should include a quantified air pollution model as well as an updated, quantified refined health risk assessment which adequately and accurately evaluates health risk impacts associated with both Project construction and operation.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Emissions

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 2,920.96 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year"), which would not exceed the SCAQMD bright-line threshold of 3,000 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4).

Table 4.6-4. Estimated Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Area	4.45	<0.01[a]	0.00	4.56
Energy (natural gas and electricity)	951.51	0.03	0.01	955.38
Mobile	1,764.82	0.08	0.00	1,766.93
Solid waste	17.53	1.04	0.00	43.42
Water supply and wastewater	80.60	0.02	0.01	84.77
Construction (amortized over 30 years)	—	—	—	65.90
			Total Emissions	2,920.96
			SCAQMD GHG Threshold	3,000
			Exceeds thresholds?	No

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrogen dioxide; CO_2e = carbon dioxide equivalent.
See Appendix C-1 for complete results.
Proposed Project GHG emissions are based on the "mitigated" CalEEMod outputs, which includes reduction in indoor and outdoor water consumption, consistent with CALGreen and compliance with the AB 939 waste reduction goal.
[a] <0.01 = value less than reported 0.01 metric tons per year.

Furthermore, the DEIR relies upon the Project's consistency with the City of El Segundo Climate Action Plan ("CAP"), SCAG's 2020-2045 *RTP/SCS*, CALGreen, CARB's *Scoping Plan*, and the General Plan's Air Quality Element, as well as EO S-3-05 and SB 32, in order to conclude that the Project would result in a less-than-significant GHG impact (p. 4.6-29 - 4.6-48). However, the DEIR's GHG analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons.

(1) The DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
(2) The DEIR's quantitative GHG analysis relies upon an outdated threshold;
(3) The DEIR's unsubstantiated air model indicates a potentially significant impact;
(4) The DEIR fails to consider the performance-based standards under CARB's *Scoping Plan*; and
(5) The DEIR fails to consider the performance-based standards under SCAG's *RTP/SCS*.

1-43

1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 2,920.96 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the CalEEMod Outputs, provided as Appendix C-1 to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

1-44

2) Incorrect Reliance on an Outdated Quantitative GHG Threshold

As previously discussed, the DEIR estimates that the Project would generate net annual GHG emissions 2,920.96 MT CO_2e/year, which would not exceed the SCAQMD bright-line threshold of 3,000 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4). However, the guidance that provided the 3,000 MTCO_2/year threshold, the SCAQMD's 2008 *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules, and Plans* report, was developed when the Global Warming Solutions Act of 2006, commonly known as "AB 32", was the governing statute for GHG reductions in California. AB 32 requires California to reduce GHG emissions to 1990 levels by 2020.[42] As it is already April 2021, thresholds for 2020 are not applicable to the proposed Project. As such, the SCAQMD bright-line threshold of 3,000 MT CO_2e/year is outdated and inapplicable to the proposed Project, and the DEIR's less-than-significant GHG impact conclusion should not be relied upon.

Instead, we recommend that the Project apply the widely-used 2030 "Substantial Progress" threshold of 660 MT CO_2e/year[43] and AEP's "2030 Land Use Efficiency Threshold" of 2.6 metric tons of CO_2 equivalents per service population per year ("MT CO_2e/SP/year").[44] In support of thresholds for projects with a horizon year beyond 2020, AEP's guidance *states:*

> "Once the state has a full plan for 2030 (which is expected in 2017), and then *a project with a horizon between 2021 and 2030 should be evaluated based on a threshold using the 2030 target*. A more conservative approach would be to apply a 2030 threshold *based on SB 32* for any project with a horizon between 2021 and 2030 regardless of the status of the Scoping Plan Update" (emphasis added).[45]

As the California Air Resources Board ("CARB") adopted *California's 2017 Climate Change Scoping Plan* in November of 2017, the proposed Project "should be evaluated based on a threshold using the 2030 target," according to the relevant guidance referenced above. We recommend the preparation of an updated EIR to compare the Project's estimated GHG emissions, as estimated in an updated air model,

to the widely-used 2030 "Substantial Progress" threshold of 660 MT CO_2e/year[46] and AEP's "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e/SP/year.

1-45 Cont.

3) Failure to Identify a Potentially Significant GHG Impact

When applying the widely-used 2030 "Substantial Progress" threshold of 660 MT CO_2e/year[47] and AEP "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e/SP/year,[48] the DEIR's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.[49] As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 2,920.96 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4). Furthermore, according to CAPCOA's *CEQA & Climate Change* report, service population is defined as "the sum of the number of residents and the number of jobs supported by the project."[50] The DEIR estimates that the Project would house and employ approximately 618 residents and 56 employees, respectively, resulting in a service population of 674 people (p. IV.G-17, Table IV.G-4; IV.G-19, Table IV.G-5).[51] When dividing the Project's GHG emissions, as estimated by the DEIR, by a service population of 674 people, we find that the Project would emit approximately 4.3 MT CO_2e/SP/year (see table below).[52]

[49] "Beyond Newhall and 2020: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California." Association of Environmental Professionals (AEP), October 2016, *available at:* https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf, p. 40.

[50] CAPCOA (Jan. 2008) CEQA & Climate Change, p. 71-72, http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA-White-Paper.pdf.

[51] Calculated: 618 residents + 56 employees = 674 service population.

[52] Calculated: (2,920.96 MT CO_2e/year) / (674 service population) = (4.3 MT CO_2e/SP/year).

DEIR Modeling Greenhouse Gas Emissions	
Project Phase	**Proposed Project (MT CO_2e/year)**
Net Annual GHG Emissions	**2,921**
Threshold	660
Exceed?	***Yes***
Service Population	674
Service Population Efficiency	**4.3**
Threshold	2.6
Exceed?	***Yes***

1-46 Cont.

As demonstrated above, the Project's net annual GHG emissions and service population efficiency, as estimated by the DEIR, exceed the 2030 "Substantial Progress" threshold of 660 MT CO_2e/SP/year and AEP's "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e/SP/year, respectively. As a result, the DEIR's less-than-significant GHG impact conclusion should not be relied upon. An updated EIR should be prepared for the Project and mitigation measures should be implemented to reduce the Project's GHG emissions to less-than-significant levels.

4) Failure to Consider Performance-based Standards Under CARB's 2017 Scoping Plan

As previously discussed, the DEIR relies upon the Project's consistency with CARB's 2017 *Scoping Plan* to determine Project GHG significance (p. 4.6-41 – 4.6-45). However, this is incorrect, as the DEIR fails to consider performance-based measures proposed by CARB.

i. Passenger & Light Duty VMT Per Capita Benchmarks per SB 375

In reaching the State's long-term GHG emission reduction goals, CARB's 2017 *Scoping Plan* explicitly cites to SB 375 and the VMT reductions anticipated under the implementation of Sustainable Community Strategies.[53] CARB has identified the population and daily VMT from passenger autos and light-duty vehicles at the state and county level for each year between 2010 to 2050 under a "baseline scenario" that includes "current projections of VMT included in the existing Regional Transportation Plans/Sustainable Communities Strategies (RTP/SCSs) adopted by the State's 18 Metropolitan Planning Organizations (MPOs) pursuant to SB 375 as of 2015."[54] By dividing the projected daily VMT by the population, we calculated the daily VMT per capita for each year at the state and county level for 2010 (baseline year), 2025 (Project operational year), and 2030 (target years under SB 32) (see table below and Attachment B).

1-47

[53] "California's 2017 Climate Change Scoping Plan." CARB, November 2017, *available at*: https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, p. 25, 98, 101-103.
[54] "Supporting Calculations for 2017 Scoping Plan-Identified VMT Reductions," Excel Sheet "Readme." CARB, January 2019, *available at*: https://ww2.arb.ca.gov/sites/default/files/2019-01/sp_mss_vmt_calculations_jan19_0.xlsx.

2017 Scoping Plan Daily VMT Per Capita						
	Los Angeles County			State		
Year	Population	LDV VMT Baseline	VMT Per Capita	Population	LDV VMT Baseline	VMT Per Capita
2010	9,838,771	216,979,221.64	22.05	37,335,085	836,463,980.46	22.40
2025	10,671,800	217,340,094.90	20.37	42,326,397	929,443,512.65	21.96
2030	10,868,614	215,539,586.12	19.83	43,939,250	957,178,153.19	21.78

The below table compares the 2017 *Scoping Plan* daily VMT per capita values against the daily VMT per capita values for the Project based on SWAPE's updated modeling (see table below and Attachment B).

Daily VMT Per Capita from Passenger & Light-Duty Trucks, Exceedances under 2017 Scoping Plan Performance-Based SB 375 Benchmarks	
Sources	Project
	SWAPE Modeling
Annual VMT from Auto & Light-Duty Vehicles	5,937,594
Daily VMT from Auto & Light-Duty Vehicles	16,267
Service Population	674
Daily VMT Per Capita	24.14
2017 Scoping Plan Benchmarks, Statewide	
22.40 VMT (2010 Baseline) Exceed?	Yes
21.96 VMT (2025 Projected) Exceed?	Yes
21.78 VMT (2030 Projected) Exceed?	Yes
2017 Scoping Plan Benchmarks, Los Angeles County Specific	
22.05 VMT (2010 Baseline) Exceed?	Yes
20.37 VMT (2025 Projected) Exceed?	Yes
19.83 VMT (2030 Projected) Exceed?	Yes

As shown above, SWAPE's updated modeling shows that the Project exceeds the CARB 2017 *Scoping Plan* projections for 2010, 2025, and 2030. Because the exceeds the CARB 2017 *Scoping Plan* performance-based daily VMT per capita projections, the Project conflicts with the CARB 2017 *Scoping Plan* and SB 375. As such, the DEIR's claim that the proposed Project would not conflict with the CARB 2017 *Scoping Plan* is unsupported. Project-specific EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

1-47 Cont.

5) Failure to Consider Performance-based Standards under SCAG's RTP/SCS

Here, as discussed above, the DEIR concludes that the Project would be consistent with SCAG's *RTP/SCS* (p. 4.6-34 – 4.6-37). However, the DEIR fails to consider whether or not the Project meets any of the specific performance-based goals underlying SCAG's *RTP/SCS* and SB 375, such as: i) per capita GHG emission targets, or ii) daily vehicles miles traveled ("VMT") per capita benchmarks.

1-48

i. SB 375 Per Capita GHG Emission Goals

SB 375 was signed into law in September 2008 to enhance the state's ability to reach AB 32 goals by directing CARB to develop regional 2020 and 2035 GHG emission reduction targets for passenger vehicles (autos and light-duty trucks). In March 2018, CARB adopted updated regional targets requiring a 19 percent decrease in VMT for the SCAG region by 2035. This goal is reflected in SCAG's 2020 RTP/SCS Program Environmental Impact Report ("PEIR"),[55] in which the 2020 RTP/SCS PEIR updates the per capita emissions to 18.8 lbs/day in 2035 (*see* excerpt below).[56]

Table 3.8-10
SB 375 Analysis

	2005 (Baseline)	2020 (Plan)	2035 (Plan)
Resident population (per 1,000)	17,161	19,194	21,110
CO2 emissions (per 1,000 tons)	204.0/a/	204.5/a/	198.6/b/
Per capita emissions (pounds/day)	23.8	21.3	18.8
% difference from Plan (2020) to Baseline (2005)			-8%
% difference from Plan (2035) to Baseline (2005)			-19%

Note:
/a/ Based on EMFAC2007
/b/Based on EMFAC2014 and SCAG modeling, 2019.
/c/ Includes off-model adjustments for 2035 and 2045

http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf

1-48 Cont.

In order to evaluate consistency with this SB 375 objective and SCAG's *RTP/SCS* performance-based goal, SWAPE calculated the Project's per-capita CO_2 emissions from passenger and light duty vehicles (calculations attached hereto as Attachment B). First, total annual GHG mobile emissions were multiplied by the percentage of auto and light-duty truck fleet mix, then converted into total pounds per day, then divided by the estimated service population of 674. The below table shows the per capita emissions for the Project based on SWAPE's updated modeling (see table below and Attachment B).

[55] "Connect SoCal Certified Final Program Environmental Impact Report." SCAG, May 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_complete.pdf?1607981618.
[56] "Connect SoCal Certified Final Program Environmental Impact Report." SCAG, May 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_complete.pdf?1607981618, p. 3.8-74.

CO_2e Per Capita Emissions from Passenger & Light-Duty Trucks, Exceedances under RTP/SCS Performance-Based SB 375 Goals	
Sources	**Project**
	SWAPE Modeling
Annual Mobile Emissions (MT CO_2e/year)	2,553.25
Passenger & Light-Duty Fleet Mix (%)	91.23%
Daily CO_2e Emissions (lbs/day)	14,068.52
Service Population	674
Per Capita Emissions (lbs/day)	**20.87**
18.8 lbs/day/SP (2045 Target) Exceeded?	Yes

As shown in the above table, when utilizing the DEIR's modeling, the Project would result in 20.87 pounds per day per service population ("lbs/day/SP") emissions. This exceeds SCAG's 2035 target of 18.8-lbs/day/SP, indicating that the Project is inconsistent with SB 375 and SCAG's *RTP/SCS*.

1-48 Cont.

i. SB 375 RTP/SCS Daily VMT Per Capita Target

Under the SCAG's 2020 *RTP/SCS*, daily VMT per capita in the SCAG region should decrease from 23.2 VMT in 2016 to 20.7 VMT by 2045.[57] Daily VMT per capita in Los Angeles County should decrease from 22.2 to 19.2 VMT during that same period.[58]

Here, however, the DEIR fails to consider any of the above-mentioned performance-based VMT targets. In order to evaluate consistency with the *RTP/SCS*'s performance-based VMT reduction targets, SWAPE calculated the Project's VMT from passenger and light duty vehicles (calculations attached hereto as Attachment B). First, annual VMTs from passenger automobile and light-duty vehicle were calculated based on the CalEEMod default fleet mix, converted into daily VMT, and divided by the estimated service population of 674. The below table shows the daily VMT per capita for the Project based on SWAPE's updated modeling (see table below and Attachment B).

[57] "Connect SoCal." SCAG, September 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176, pp. 138.
[58] "Connect SoCal." SCAG, September 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176, pp. 138.

Daily VMT Per Capita from Passenger & Light-Duty Trucks, Exceedances under RTP/SCS Performance-Based SB 375 Target	
Sources	**Project SWAPE Modeling**
Annual VMT from Auto & Light-Duty Vehicles	5,937,594
Daily VMT from Auto & Light-Duty Vehicles	16,267
Service Population	674
Daily VMT Per Capita	24.14
2020 RTP/SCS Benchmarks, SCAG-Wide	
23.2 VMT (2016 Baseline) Exceed?	**Yes**
20.7 VMT (2045 Target) Exceed?	**Yes**
2020 RTP/SCS Benchmarks, Los Angeles County	
22.2 VMT (2016 Baseline) Exceed?	**Yes**
19.2 VMT (2045 Target) Exceed?	**Yes**

1-48 Cont.

As shown in the above table, based on a service population of 674, the Project would result in 24.14 VMT per capita from passenger auto and light-duty truck vehicles. This exceeds all SCAG-wide and Los Angeles County-specific benchmarks and targets under SCAG's 2020 *RTP/SCS*. Thus, based on SWAPE's updated modeling, the Project would exceed the 2016 baseline and 2045 target VMT per capita values for both Los Angeles County and the SCAG region as a whole, indicating that the Project conflicts with the SCAG's *RTP/SCS* and SB 375.

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in potentially significant health risk and GHG impacts that should be mitigated further. In an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Feasible mitigation measures can be found in CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures*.[59] Therefore, to reduce the Project's emissions, consideration of the following measures should be made:

CAPCOA's Quantifying Greenhouse Gas Mitigation Measures[60]
Measures – Energy
Building Energy Use
Install Programmable Thermostat Timers
Obtain Third-party HVAC Commissioning and Verification of Energy Savings

1-49

[59] http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf
[60] "Quantifying Greenhouse Gas Mitigation Measures." California Air Pollution Control Officers Association (CAPCOA), August 2010, *available at:* http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf, p.

Install Energy Efficient Appliances
Install Energy Efficient Boilers
Lighting
Install Higher Efficacy Public Street and Area Lighting
Limit Outdoor Lighting Requirements
Replace Traffic Lights with LED Traffic Lights
Alternative Energy Generation
Establish Onsite Renewable or Carbon-Neutral Energy Systems
Establish Onsite Renewable Energy System – Solar Power
Utilize a Combined Heat and Power System
Measures – Transportation
Land Use/Location
Increase Density
Increase Destination Accessibility
Integrate Affordable and Below Market Rate Housing
Neighborhood/Site Enhancements
Provide Pedestrian Network Improvements, such as: • Compact, mixed-use communities • Interconnected street network • Narrower roadways and shorter block lengths • Sidewalks • Accessibility to transit and transit shelters • Traffic calming measures and street trees • Parks and public spaces • Minimize pedestrian barriers
Provide Traffic Calming Measures, such as: • Marked crosswalks • Count-down signal timers • Curb extensions • Speed tables • Raised crosswalks • Raised intersections • Median islands • Tight corner radii • Roundabouts or mini-circles • On-street parking • Planter strips with trees • Chicanes/chokers
Implement a Neighborhood Electric Vehicle (NEV) Network.
Create Urban Non-Motorized Zones.

1-49 Cont.

28

Dedicate Land for Bike Trails
Parking Policy/Pricing
Limit Parking Supply through: • Elimination (or reduction) of minimum parking requirements • Creation of maximum parking requirements • Provision of shared parking
Unbundle Parking Costs from Property Cost
Implement Market Price Public Parking (On-Street)
Require Residential Area Parking Permits
Commute Trip Reduction Programs
Implement Commute Trip Reduction (CTR) Program – Voluntary • Carpooling encouragement • Ride-matching assistance • Preferential carpool parking • Flexible work schedules for carpools • Half time transportation coordinator • Vanpool assistance • Bicycle end-trip facilities (parking, showers and lockers) • New employee orientation of trip reduction and alternative mode options • Event promotions and publications • Flexible work schedule for employees • Transit subsidies • Parking cash-out or priced parking • Shuttles • Emergency ride home
Implement Commute Trip Reduction (CTR) Program – Required Implementation/Monitoring • Established performance standards (e.g. trip reduction requirements) • Required implementation • Regular monitoring and reporting
Provide Ride-Sharing Programs • Designate a certain percentage of parking spaces for ride sharing vehicles • Designating adequate passenger loading and unloading and waiting areas for ride-sharing vehicles • Providing a web site or messaging board for coordinating rides • Permanent transportation management association membership and funding requirement.
Implement Subsidized or Discounted Transit Program
Provide End of Trip Facilities, including: • Showers • Secure bicycle lockers • Changing spaces
Encourage Telecommuting and Alternative Work Schedules, such as: • Staggered starting times • Flexible schedules

1-49 Cont.

29

• Compressed work weeks
Implement Commute Trip Reduction Marketing, such as: • New employee orientation of trip reduction and alternative mode options • Event promotions • Publications
Implement Preferential Parking Permit Program
Implement Car-Sharing Program
Provide Employer-Sponsored Vanpool/Shuttle
Implement Bike-Sharing Programs
Price Workplace Parking, such as: • Explicitly charging for parking for its employees; • Implementing above market rate pricing; • Validating parking only for invited guests; • Not providing employee parking and transportation allowances; and • Educating employees about available alternatives.
Implement Employee Parking "Cash-Out"
Transit System Improvements
Transit System Improvements, including: • Grade-separated right-of-way, including bus only lanes (for buses, emergency vehicles, and sometimes taxis), and other Transit Priority measures. Some systems use guideways which automatically steer the bus on portions of the route. • Frequent, high-capacity service • High-quality vehicles that are easy to board, quiet, clean, and comfortable to ride. • Pre-paid fare collection to minimize boarding delays. • Integrated fare systems, allowing free or discounted transfers between routes and modes. • Convenient user information and marketing programs. • High quality bus stations with Transit Oriented Development in nearby areas. • Modal integration, with BRT service coordinated with walking and cycling facilities, taxi services, intercity bus, rail transit, and other transportation services.
Implement Transit Access Improvements, such as: • Sidewalk/crosswalk safety enhancements • Bus shelter improvements
Expand Transit Network
Increase Transit Service Frequency/Speed
Provide Local Shuttles
Road Pricing/Management
Implement Area or Cordon Pricing
Improve Traffic Flow, such as: • Signalization improvements to reduce delay; • Incident management to increase response time to breakdowns and collisions;

1-49 Cont.

30

• Intelligent Transportation Systems (ITS) to provide real-time information regarding road conditions and directions; and • Speed management to reduce high free-flow speeds.
Required Project Contributions to Transportation Infrastructure Improvement Projects
Install Park-and-Ride Lots
Vehicles
Utilize Alternative Fueled Vehicles, such as: • Biodiesel (B20) • Liquefied Natural Gas (LNG) • Compressed Natural Gas (CNG)
Utilize Electric or Hybrid Vehicles
Measures – Water
Water Supply
Use Reclaimed Water
Use Gray Water
Use Locally Sourced Water Supply
Water Use
Install Low-Flow Water Fixtures
Adopt a Water Conservation strategy
Design Water-Efficient Landscapes (see California Department of Water Resources Model Water Efficient Landscape Ordinance), such as: • Reducing lawn sizes; • Planting vegetation with minimal water needs, such as native species; • Choosing vegetation appropriate for the climate of the project site; • Choosing complimentary plants with similar water needs or which can provide each other with shade and/or water.
Use Water-Efficient Landscape Irrigation Systems ("Smart" irrigation control systems)
Reduce Turf in Landscapes and Lawns
Measures – Area Landscaping
Landscaping Equipment
Prohibit Gas Powered Landscape Equipment
Electric Yard Equipment Compatibility
Measures – Solid Waste
Solid Waste
Recycle Demolished Construction Material
Measures – Vegetation
Vegetation
Urban Tree Planting

1-49 Cont.

31

Create New Vegetated Open Space
Measures – Construction
Construction
Use Alternative Fuels for Construction Equipment
Urban Tree Planting
Use Electric and Hybrid Construction Equipment
Limit Construction Equipment Idling Beyond Regulation Requirements
Institute a Heavy-Duty Off-Road Vehicle Plan, including: • Construction vehicle inventory tracking system; • Requiring hour meters on equipment; • Document the serial number, horsepower, manufacture age, fuel, etc. of all onsite equipment; and • Daily logging of the operating hours of the equipment.
Implement a Construction Vehicle Inventory Tracking System
Measures – Miscellaneous
Miscellaneous
Establish a Carbon Sequestration Project, such as: • Geologic sequestration or carbon capture and storage techniques, in which CO_2 from point sources is captured and injected underground; • Terrestrial sequestration in which ecosystems are established or preserved to serve as CO_2 sinks; • Novel techniques involving advanced chemical or biological pathways; or • Technologies yet to be discovered.
Establish Off-Site Mitigation
Use Local and Sustainable Building Materials
Require Environmentally Responsible Purchasing, such as: • Purchasing products with sustainable packaging; • Purchasing post-consumer recycled copier paper, paper towels, and stationary; • Purchasing and stocking communal kitchens with reusable dishes and utensils; • Choosing sustainable cleaning supplies; • Leasing equipment from manufacturers who will recycle the components at their end of life; • Choosing ENERGY STAR appliances and Water Sense-certified water fixtures; • Choosing electronic appliances with built in sleep-mode timers; • Purchasing 'green power' (e.g. electricity generated from renewable or hydropower) from the utility; and • Choosing locally-made and distributed products.

1-49 Cont.

Furthermore, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project from NEDC's *Diesel Emission Controls in Construction*

32

Projects.[61] Therefore, to reduce the Project's emissions, consideration of the following measures should be made:

NEDC's *Diesel Emission Controls in Construction Projects*[62]
Measures – Diesel Emission Control Technology
a. Diesel Onroad Vehicles All diesel nonroad vehicles on site for more than 10 total days must have either (1) engines that meet EPA onroad emissions standards or (2) emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%.
b. Diesel Generators All diesel generators on site for more than 10 total days must be equipped with emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%.
c. Emission control technology shall be operated, maintained, and serviced as recommended by the emission control technology manufacturer.
Measures – Additional Diesel Requirements
a. Construction shall not proceed until the contractor submits a certified list of all diesel vehicles, construction equipment, and generators to be used on site. The list shall include the following: i. Contractor and subcontractor name and address, plus contact person responsible for the vehicles or equipment. ii. Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. iii. For the emission control technology installed: technology type, serial number, make, model, manufacturer, EPA/CARB verification number/level, and installation date and hour-meter reading on installation date.
b. If the contractor subsequently needs to bring on site equipment not on the list, the contractor shall submit written notification within 24 hours that attests the equipment complies with all contract conditions and provide information.
c. All diesel equipment shall comply with all pertinent local, state, and federal regulations relative to exhaust emission controls and safety.
d. The contractor shall establish generator sites and truck-staging zones for vehicles waiting to load or unload material on site. Such zones shall be located where diesel emissions have the least impact on abutters, the general public, and especially sensitive receptors such as hospitals, schools, daycare facilities, elderly housing, and convalescent facilities.
Reporting
a. For each onroad diesel vehicle, nonroad construction equipment, or generator, the contractor shall submit to the developer's representative a report prior to bringing said equipment on site that includes: i. Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, and engine serial number.

33

ii. The type of emission control technology installed, serial number, make, model, manufacturer, and EPA/CARB verification number/level. iii. The Certification Statement signed and printed on the contractor's letterhead.	
b. The contractor shall submit to the developer's representative a monthly report that, for each onroad diesel vehicle, nonroad construction equipment, or generator onsite, includes: i. Hour-meter readings on arrival on-site, the first and last day of every month, and on off-site date. ii. Any problems with the equipment or emission controls. iii. Certified copies of fuel deliveries for the time period that identify: 1. Source of supply 2. Quantity of fuel 3. Quality of fuel, including sulfur content (percent by weight)	1-49 Cont.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include an updated health risk and GHG analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties. 1-50

Sincerely,

Matt Hagemann, P.G., C.Hg.

Paul E. Rosenfeld, Ph.D.

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding underestimated land use sizes.

Construction Phase - Consistent with the DEIR's model.

Trips and VMT - See SWAPE comment regarding hauling trips. Worker and vendor trips consistent with the DEIR's model.

On-road Fugitive Dust -

Demolition - See SWAPE comment regarding demolition.

Grading - See SWAPE comment regarding acres of grading values, material mositure content, and material silt content. Material export consistent with the DEIR's model.

Architectural Coating - Architectural coating EFs consistent with the DEIR's model. See SWAPE comment regarding architectural coating areas.

Vehicle Trips - See SWAPE comment regarding operational vehicle trip rates.

Woodstoves - Consistent with the DEIR's model.

Area Coating - See SWAPE comment regarding area coating areas.

Energy Use -

Water And Wastewater - See SWAPE comment regarding wastewater treatment percentages.

Construction Off-road Equipment Mitigation - See SWAPE comment regarding construction-related mitigation measures.

Mobile Land Use Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding underestimated land use sizes.

Construction Phase - Consistent with the DEIR's model.

Trips and VMT - See SWAPE comment regarding hauling trips. Worker and vendor trips consistent with the DEIR's model.

On-road Fugitive Dust -

Demolition - See SWAPE comment regarding demolition.

Grading - See SWAPE comment regarding acres of grading values, material mositure content, and material silt content. Material export consistent with the DEIR's model.

Architectural Coating - Architectural coating EFs consistent with the DEIR's model. See SWAPE comment regarding architectural coating areas.

Vehicle Trips - See SWAPE comment regarding operational vehicle trip rates.

Woodstoves - Consistent with the DEIR's model.

Area Coating - See SWAPE comment regarding area coating areas.

Energy Use -

Water And Wastewater - See SWAPE comment regarding wastewater treatment percentages.

Construction Off-road Equipment Mitigation - See SWAPE comment regarding construction-related mitigation measures.

Mobile Land Use Mitigation - See SWAPE comment regarding operational mitigation measures.

SWAPE Technical Consultation, Data Analysis and Litigation Support for the Environment

SOIL WATER AIR PROTECTION ENTERPRISE
2656 29th Street, Suite 201
Santa Monica, California 90405
Attn: Paul Rosenfeld, Ph.D.
Mobil: (310) 795-2335
Office: (310) 452-5555
Fax: (310) 452-5550
Email: prosenfeld@swape.com

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

1-52

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association, Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:
M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:
California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:
Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

1-52 Cont.

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 150 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

1-52 Cont.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

1-52 Cont.

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

4

1-52 Cont.

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

5

INTENTIONALLY LEFT BLANK

Response to Comment Letter 1

Southwest Regional Council of Carpenters
(via Mitchell M. Tsai, Attorney at Law)
December 8, 2021

1-1 In summary, this comment includes an introductory statement and a general summary of the proposed Project's description.

The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

1-2 This comment requests the City to provide notice to the commenter of all notices referring or related to the proposed Project.

The commenter's request will be granted in accordance with the California Public Records Act (Government Code §§6250-6270); California Environmental Quality Act (CEQA) (Public Resource Code §21000 et seq); and Planning and Zoning Law (Government Code §§65000-65010), as cited in the letter. Additionally, in accordance with CEQA Guidelines Section 15094, the Lead Agency (the City of El Segundo) shall file a Notice of Determination (NOD) within five working days after deciding to carry out or approve the Project. The NOD will also be filed with the Los Angeles County Clerk and the Governor's Office of Planning and Research State Clearinghouse. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

1-3 In summary, this comment states the City should require the Project applicant to provide additional community benefits such as local hire project labor agreement to construct the proposed Project. Furthermore, the comment cites Comment 1-26 for more discussion.

Please refer to Response to Comment 1-26.

This comment requests that the City consider utilizing "skilled and trained workforce policies and requirements". This comment is interpreted to be a request that the City implement a "local hire" requirement on the proposed Project, citing economic benefits and benefits to greenhouse gas, air quality, and transportation impacts. As stated in Draft EIR Sections 4.2, Air Quality, 4.6, Greenhouse Gas Emissions, and Section 4.13, Transportation, there are no significant short-term construction-related or long-term operational environmental impacts that are related to the length of vehicle trips or the proximity of workers to the Project site. Therefore, there is no obligation under CEQA to consider implementation of skilled and trained workforce requirements, and no changes to the EIR are required.

Additionally, the comment requests that the City require the Project to be built to standards exceeding the 2019 California Green Building Code (CalGreen) to mitigate environmental impacts. Draft EIR Sections 4.4, Energy and 4.6, Greenhouse Gas Emissions, determined impacts would be less than significant and no mitigation was required. The proposed Project would be built in accordance with the current Building Energy Efficiency Standards (Title 24) at the time of construction, which include robust requirements for energy efficiency (Draft EIR page 4.4-14). Moreover, Table 4.6-8, Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies, demonstrates that the proposed

Project would be consistent with the City's Municipal Code and CalGreen requirements (Draft EIR page 4.6-43). Given this, the proposed Project currently meets required standards and no change or addition is required to the Draft EIR's environmental analysis. However, this comment is acknowledged and will be taken into consideration by the City's decision markers.

1-4 In summary, this comment cites various excerpts of case law and related to CEQA's legislative intent to inform decision makers and the public and avoid and reduce environmental impacts or adopt a statement of overriding considerations.

The EIR for the proposed Project was prepared in compliance with CEQA and the CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 *et seq.* The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

1-5 In summary, this comment states that significant revisions to Chapter 3, Changes to the Draft EIR, of the Final EIR were made, thus, requiring recirculation of the EIR due to changes to transportation and cumulative impacts analyses with the addition of three additional related projects.

Chapter 2, Responses to Comments, of the Final EIR addressed concerns associated with cumulative impact analyses. As discussed in Topical Response No. 1 – Cumulative Impacts (starting on Final EIR page 2-2), the City added three reasonably foreseeable projects shown and incorporated in Table 2-2, Additional Related Projects. Topical Response No. 1 determined the additions do not change the impact conclusions in the Draft EIR, nor do they result in any new significant impacts or the need for new or altered mitigation measures, as further demonstrated in Topical Response No. 1. Given that these changes would not result in a new significant impact or in an increase in the severity of a previously identified significant impact, pursuant to CEQA Guidelines Section 15088.5, recirculation of the Draft EIR is not required.

Regarding the commenter's assertion about the Final EIR's transportation analysis, Topical Response No. 1 concluded the addition of three related projects would not change the Draft EIR's determination. Appendix A, Revised Future Analysis, of the Final EIR was included to support this conclusion. For example, the addition of three related projects would not change the proposed Project's proximity to public transit and the Project (and other related projects) would cumulatively contribute to transit ridership maintained by Metro and LADOT, which would result in less than significant impacts. Additionally, the Final EIR demonstrated the addition of three related projects would not result in a cumulatively significant impact related to vehicle miles traveled (VMT). As further described in Chapter 2 of the Final EIR, the Project's VMT would fall below SCAG's efficiency-based threshold and the Project site is located within an urbanized area served by public transit. Therefore, the Project's contribution to cumulative VMT would not be cumulatively considerable.

Finally, the comment notes changes to the Draft EIR have been made to the Project's trip generation, traffic volume, and level of service (LOS) analyses. As detailed in Chapter 2, Responses to Comments, of the Final EIR, discussion of the changes in the LOS analysis were made for informational purposes related to the applicability of the City's General Plan policies. However, automobile delay and traffic congestion are not considered to be impacts on the environment for the purposes of traffic and transportation analysis (California Public Resources Code Section 21099(b)(2)). As such, the City's LOS

policy is not applicable under CEQA per Senate Bill (SB) 743. No change or addition to the EIR's environmental analyses are required.

1-6 In summary, this comment states the Southwest Regional Council of Carpenters submitted comments to the Draft EIR on April 12, 2021. However, an administrative error occurred. As such, the comment letter was not included in Final EIR Chapter 2, Responses to Comments.

The City acknowledges the receipt of the pre-dated comment letter, which is included as Comments 1-8 through 1-25. Please see Responses to Comments 1-8 through 1-25 for responses to the letter.

1-7 In summary, this comment states opposition to the proposed Project and requests revisions and recirculation of the Draft EIR.

The commenter's general opposition to the Project will be provided to the City's decision makers for their review and consideration.

Responses 1-8 through 1-25 are for "Exhibit A, April 12, 2021 SWRCC Letter to Paul Samaras"

1-8 Please refer to Response to Comment 1-1.

1-9 Please refer to Response to Comment 1-2.

1-10 Please refer to Response to Comment 1-3.

1-11 In summary, this comment states a summary of the qualifications of Matt Hagemann, P.G., C.Hg. and Paul Rosenfeld, Ph.D and refers to their comments regarding the Draft EIR's greenhouse gas emissions analyses, which are attached to the primary comment letter.

The comment does not express any environmental comments or concerns related to the analysis in the Draft EIR. The aforementioned comments are included as Comments 1-26 and 1-28 through 1-51. As such, please see Responses to Comments 1-26 and 1-28 through 1-51, for more discussion.

1-12 Please refer to Response to Comment 1-4.

1-13 Please refer to Response to Comment 1-5.

1-14 In summary, this comment recommends that the City adopt mitigation measures to mitigate public health risks related to COVID-19 during construction of the proposed Project.

The potential for Project construction to cause COVID-19 to spread through worker exposure is not an impact on the environment under CEQA, rather it is a public health concern under the purview of federal, state, and local public health agencies. CEQA requires the consideration of significant changes in the environment caused by a proposed project; therefore, an existing adverse environmental condition that a project does not create or exacerbate is not responsible for mitigating that adverse condition. Implementation of the proposed Project would not create or exacerbate an existing environmental hazard or an existing public health hazard, and therefore, no mitigation is required. Compliance with existing mandates from federal, state, and local public health agencies, including California Occupational Safety and Health Administration's (Cal/OSHA) *COVID-19 Prevention Emergency Temporary Standards* (ETS) are specifically intended to

address workplace health and safety (OSHSB 2021). Policy mandates from public health agencies are consistently updated to address rapidly changing circumstances and provide the most appropriate and methods for protecting worker safety. For instance, the most recent Order from the County of Los Angeles Department of Public Health requires that by January 17, 2022, mandates that employers must provide their employees who work indoors and in close contact with other workers or the public, and require them to wear, a well-fitting medical grade mask, surgical mask, or higher-level respirator, such as an N95 filtering facepiece respirator or KN95, at all times while indoors at the worksite or facility (LACDPH 2022). In addition to mandatory measures set forth by the County of Los Angeles Department of Public Health related to masking in the workplace and Cal/OSHA's *COVID-19 Prevention Emergency Temporary* Standards (ETS), there are other federal OSHA standards that apply to protecting workers from infection include: requirements for personal protective equipment (PPE) (29 CFR part 1910, Subpart I (e.g., 1910.132 and 133)), respiratory protection (29 CFR 1910.134), sanitation (29 CFR 1910.141), and OSHA's requirements for employee access to medical and exposure records (29 CFR 1910.1020). Employers are also required by the General Duty Clause, Section 5(a)(1) of the OSH Act, to provide a safe and healthful workplace free from recognized hazards that are causing or likely to cause death or serious physical harm (OSHA 2021).

Therefore, compliance with mandatory federal, state, and local public health agency regulations would ensure adequate and appropriate protections for workplace safety and the proposed Project would not create or exacerbate an existing environmental or public health hazard. There is no aspect of the proposed Project that would prevent or interfere with the United Brotherhood of Carpenters providing the Carpenter union members with additional trainings related to COVID-19. No changes to the project description or environmental analyses included in the Draft EIR are required.

1-15 In summary, this comment states the Draft EIR defers details within specific mitigation measures, as detailed below.

In summary, this comment states MM-CUL-1 does not include details of the Worker Environmental Awareness Program (WEAP) to reduce potential impacts to archeological resources. As described in Draft EIR Section 4.3, Cultural Resources, mitigation measure MM-CUL-1 includes numerous requirements that must be included in the training program, which include: (1) inform workers about sensitivity of the Project area, (2) provide specific details on the kinds of archaeological materials that may be identified during construction, (3) explain the importance of and legal basis for the protection of significant archaeological resources, (4) provide actions to be taken in the event of a discovery of cultural resources (see MM CUL-2), (5) define "tribal cultural resources" and include appropriate management requirements relating to inadvertent discovery of a potential tribal cultural resource, and (6) each worker shall also learn the proper procedures to follow in the event that cultural resources or human remains are uncovered during ground-disturbing activities, which must include work curtailment or redirection, and the immediate contact of the site supervisor and archaeological monitor. Contrary to the commenter's assertion, these required components of the WEAP are detailed and include measurable performance standards for accomplishing the objectives of the WEAP. Additionally, the development of the WEAP must be conducted by a qualified archaeologist that meets the Secretary of the Interior's Professional Qualification Standards for Archaeology, and must ultimately be prepared to the satisfaction of the City. Thus, no change to the Draft EIR is required nor does MM-CUL-1 defer critical details necessary to reduce impacts.

In summary, this comment states MM-GEO-1 does not include details of the Paleontological Resources Impact Mitigation Program (PRIMP) to reduce potential impacts to paleontological resources. As described

in Draft EIR Section 4.5, Geology and Soils, mitigation measure MM-GEO-1 includes numerous requirements that must be included in the program, which include: (1) must be consistent with the Society of Vertebrate Paleontology (SVP) (2010) guidelines, (2) must provide requirements for preconstruction meeting attendance and worker environmental awareness training, (3) must provide procedures for adequate paleontological monitoring and discoveries treatment, (4) must provide paleontological methods [including sediment sampling for microvertebrate fossils], reporting, and collections management, (5) must require that a qualified paleontologist attend the preconstruction meeting and a qualified paleontological monitor be on-site during all rough grading and other significant ground-disturbing activities [including augering] in previously undisturbed, Pleistocene Sand Dune deposits, and (6) in the event that paleontological resources (e.g., fossils) are unearthed during grading, must require that a paleontological monitor temporarily halt and/or divert grading activity to allow recovery of paleontological resources. Contrary to the commenter's assertion, these required components of the PRIMP are detailed and include measurable performance standards for accomplishing the objectives of the PRIMP. Additionally, the development of the PRIMP must be conducted by a qualified paleontologist that meets SVP guidelines and must ultimately be prepared to the satisfaction of the City. Therefore, no change to the Draft EIR is required.

In summary, this comment states MM-HAZ-1 does not include any specific performance standards for removal or a plan for review. As described in Draft EIR Section 4.7, Hazards and Hazardous Materials, mitigation measure MM-HAZ-1 includes language to ensure abatement procedures for the removal of specified materials are in compliance with federal, state, and local regulations, including those of the U.S. Environmental Protection Agency (which regulates disposal), Occupational Safety and Health Administration, U.S. Department of Housing and Urban Development, California Occupational Safety and Health Administration (which regulates employee exposure), and the South Coast Air Quality Management District. Section 4.7.2, Relevant Plans, Policies, and Ordinances, of the Draft EIR identifies federal, state, regional, and local regulations included for analysis of the proposed Project and compliance during Project activities. Additionally, Table 4.1, Mitigation Monitoring and Reporting Program, of the Final EIR identifies the City of El Segundo Development Services Department as the agency responsible for monitoring implementation of MM-HAZ-1. As such, mitigation measure MM-HAZ-1 includes the necessary performance standards and regulatory compliance in order to adequately reduce impacts. Therefore, no change to the Draft EIR is required.

In summary, this comment states MM-HAZ-2's proposed Hazardous Materials Contingency Plan (HMCP) does not include a plan or performance standards to mitigate soil vapor to less than significant levels. As described in Draft EIR Section 4.7, Hazards and Hazardous Materials, mitigation measure MM-HAZ-2 includes numerous requirements that must be included in the plan, which include: (1) must include training procedures for identification of contamination, (2) must describe procedures for assessment, characterization, management, and disposal of hazardous constituents, materials, and wastes, and notification in accordance with all applicable state and local regulations, (3) must manage and dispose of any contaminated soils in accordance with local and state regulations, and (4) must include health and safety measures, which may include but are not limited to periodic work breathing zone monitoring and monitoring for volatile organic compounds using a handheld organic vapor analyzer in the event impacted soils are encountered during excavation activities. MM-HAZ-2 includes language to ensure the development of the proposed HMCP is in accordance with all applicable state and local regulations. Moreover, the MM-HAZ-2 states contaminated soils shall be managed and disposed of in accordance with local and state regulations. Section 4.7.2, Relevant Plans, Policies, and Ordinances, of the Draft EIR identifies federal, state, regional, and local regulations included for analysis of the proposed Project and compliance during Project

activities. For example, in the event of asbestos removal, Project activities would be required to comply with the National Emission Standards for Hazardous Air Pollutants (Title 40 of the United States Code (USC), Chapter 1, Subchapter C, Part 61, Subpart M) and the Toxic Substances Control Act of 1976 (Title 15 USC, Chapter 53, Subchapter I, Section 2601 et seq.). Regarding the implementation of the proposed HMCP, Project activities would be required to comply with the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (California Health and Safety Code, Division 20, Chapter 6.11, Sections 25404–25404.9). Additionally, Table 4.1, Mitigation Monitoring and Reporting Program, of the Final EIR identifies the City of El Segundo Development Services Department as the agency responsible for monitoring implementation of MM-HAZ-2. As such, mitigation measure MM-HAZ-2 includes the necessary performance standards and regulatory compliance in order to adequately reduce impacts. Therefore, no change to the Draft EIR is required.

1-16 In summary, this comment states that the Draft EIR does not support its findings with substantial evidence.

This comment does not express any environmental comments or concerns related to the analyses in the Draft EIR. Instead, as shown in Comments 1-17 through 1-20, concerns related to greenhouse gas emissions, air quality, transportation, and hazards and hazardous materials are identified as specific examples of the commenter's concern. Please see Responses to Comments 1-17 through 1-20 for more discussion.

1-17 In summary, the comment begins with an overview of caselaw related to greenhouse gas (GHG) emissions and asserts the Draft EIR did not support its findings on GHG impacts, utilized an incorrect quantitative analysis of GHG emissions, incorrectly relied upon an outdated quantitative GHG threshold, did not identify a potentially significant GHG impact; did not consider performance-based standards under California Air Resources Board's (CARB's) 2017 Scoping Plan or performance-based standards under Southern California Association of Governments' (SCAG's) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) plan, and did not consider all feasible mitigation to reduce GHG emissions.

No details or substantiation for these comments is provided; rather, the comment summarizes in a bulleted list the reasons that are discussed in detail the SWAPE letter dated April 12, 2021. Responses to the more detailed issues raised in that letter are included in Responses to Comments 1-29 through 1-49 below. None of the issues raised constitute new information that would result in significant impacts that would result in the need for recirculation of the Draft EIR. Please refer to Responses to Comments 1-29 through 1-49 below.

1-18 In summary, the comment asserts the Draft EIR's Air Quality analysis is not supported by substantial evidence.

No details or substantiation for these comments is provided; rather, the comment summarizes in a bulleted list the reasons that are discussed in detail the SWAPE letter dated April 12, 2021. Responses to the more detailed issues raised in that letter are included in Responses to Comments 1-30 through 1-42 below correspond to each of the bulleted items listed in the comment. None of the issues raised constitute new information that would result in significant impacts that would result in the need for recirculation of the Draft EIR. Please refer to Responses to Comments 1-30 through 1-42 below.

1-19 In summary, this comment states that the VMT analysis does not accurately reflect total VMT as home-based VMT analysis does not includes trips made from the other uses on the Project site, such as retail and hotel.

In the absence of VMT guidance from the City of El Segundo, State CEQA guidance from the Governor's Office of Planning and Research (OPR) was used. This document provides suggestions to lead agencies regarding methodologies to analyze VMT associated with a project. For residential projects, OPR recommends that a proposed project exceeding a level of 15% below existing daily household VMT per capita may indicate a significant transportation impact. Household VMT per capita for PCC was determined by using the Southern California Association of Government's (SCAG) 2016 Regional Transportation Plan (RTP) travel demand model. The SCAG travel demand model identifies trip purposes as Home-Based Work (HBW) and Home-Based Other (HBO), where trips have been produced by residential land uses and trips have been attracted by nonresidential land uses. Therefore, all trips produced or attracted to the residential use have been included in the VMT analysis for the project and provides an accurate estimate of the project related VMT per capita or resident.

While this is a mixed-use project with retail uses, the State's guidance does not require VMT analysis for local-serving retail land uses on the grounds that they do not increase VMT and defines local serving as less than 50,000 square feet. Since the proposed commercial components of the Project total 11,252 square feet, (i.e., less than 50,000 square feet) the VMT analysis properly focused on the proposed residential components of the Project. The hotel uses are already an existing use on the Project site and therefore, were not included in the analysis.

This comment also includes a footnote referring to the City of Santa Clarita VMT Guidelines. The Santa Clarita guidelines are intended to provide guidance for office, retail, and residential projects and thus discusses all of the different trip types. The Santa Clarita guidelines follows the OPR guidance in screening local serving retail projects with less than 50,000 square feet from VMT analysis as local serving retail generally improves the convenience of shopping close to home and has the effect of reducing vehicle travel. The guidelines also provides thresholds for each project type as outlined in the OPR guidance. Although Santa Clarita's local CEQA guidelines are in no way applicable to the City of El Segundo, it can be noted for purposes of this response that the analysis done in this EIR is consistent with the Santa Clarita guidelines. No change to the Draft EIR is required.

1-20 In summary, this comment states that additional investigation is required to characterize contamination on the Project site associated with nearby contaminated sites, including the adjacent gas station and regional tetrachloroethylene (PCE) and trichloroethylene (TCE) contamination.

With regards to the PCE and TCE contamination: As noted in the second paragraph of Draft EIR page 4.7-5, groundwater flow is west-southwest, making the PCE contamination plume downgradient from the Project site. The known and suspected contamination sources listed as part of the investigation are also downgradient of the Project site. Investigations on nearby properties, conducted between 2016 and 2018, further evidence the regional PCE and TCE contamination observed southwest of the subject property has not impacted the area of the Project site (see Appendix F of the Draft EIR).

Furthermore, a soil vapor investigation was conducted at 650 and 700 N Pacific Coast Highway, less than 200 feet northeast of the Project site, did not identify PCE or TCE contamination in soil vapor above current (2019) Environmental Screening Levels (ESLs) (City of El Segundo 2021). As such, there are no identified sources of PCE or TCE on, adjacent to, or upgradient of the Project site, there is no evidence of contamination upgradient of the Project site, and there is no evidence that the contamination plume has impacted the Project site. The Phase I ESA determined that there were no conditions that would require further analysis. Therefore, there is no evidence of impacts to future occupants.

With regards to the gas station, it is noted that contamination may be present due to operational violations, but contamination has not been identified during multiple former investigations. Out of an abundance of precaution, MM-HAZ-2 was proposed to mitigate the most likely potential contamination which may be identified during construction. Should any contamination be identified, it would be removed, the release would be reported in accordance with environmental regulatory rules and regulations (California Code of Regulations Title 19, Section 2631), and confirmation sampling would be conducted to confirm removal. These actions would further remove potential impacts to future occupants during operation of the proposed Project. No changes or additions to the project description or analyses included in the Draft EIR are required.

1-21 In summary, this comment states the Draft EIR's Project Objectives are narrow and affect the consideration of reasonable alternatives, specifically related to Project Objectives 1 and 5.

Each project objective was prepared in accordance with Section 15124(b) of the State CEQA Guidelines. Project Objective 1 is outlined in Draft EIR Section 3.5, Project Objectives, and states the following, "Provide for comprehensive site planning that maintains the existing hotel uses while providing for a mixed-use multiple-family and commercial neighborhood that is compatible with the surrounding land uses" (Draft EIR page 3-18). Contrary to the commenter's assertion, this objective is an accurate articulation of the Project Applicant's objective, which is consistent with CEQA Guidelines Section 15126.6, and would allow for consideration of a range of alternatives with reduced impacts on the environment. Alternative development scenarios are not unduly constrained by the retention of the existing hotels, as additional residential and commercial uses could occur in multiple configurations. Further, the commenter's potentially preferred scenario of not maintaining the existing hotels would not be beneficial from an environmental perspective (i.e., would increase demolition and construction-related impacts to the environment).

With regard to Objective 5, the comment notes the objective calls for "increasing the efficient use of land by eliminating surface parking lots and providing parking garages that allow for sharing among hotel commercial, and residential land uses." Contrary to the commenter's assertion, this objective is an accurate articulation of the Project Applicant's objective, which is also consistent with CEQA Guidelines Section 15126.6, and would allow for consideration of a range of alternatives with reduced impacts on the environment. Eliminating underutilized surface parking lots to allow for a densification of land use intensity and a diversity of land uses that share parking facilities to minimize parking and encourage alternative modes of transportation is specifically supportive of many City General Plan policies and objectives as outlined in Table 4.9-1 in Section 4.9, Land Use and Planning, and SCAG RTP/SCS goals as outlined in Table 4.6-6 in Section 4.6, Greenhouse Gas Emissions of the Draft EIR.

Importantly, both of these Objectives allow for numerous potential alternative development scenarios that involve both additional residential and commercial uses in multiple configurations. The retention of the existing hotels and redevelopment of underutilized surface parking are objectives of the Project Applicant and would not limit consideration of a reasonable range of alternatives. Further, CEQA Guidelines Section 15126.6(c) states: "the range alternatives to the proposed project shall include those that could feasibly accomplish ***most of the basic objectives*** of the project and could avoid or substantially lessen one or more of the significant effects." (emphasis added). Therefore, contrary to the commenter's assertion, these two Project Objectives would not "curtail any meaningful analysis or consideration of Project alternatives that substantially reduce the Project's environmental impacts." No changes to the Draft EIR are required.

1-22 In summary, this comment cites provisions of the California Government Code and case law for background on State planning and zoning law.

The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

1-23 In summary, this comment states the Draft EIR does not demonstrate consistency with the Southern California Association of Governments (SCAG) Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS), in accordance with SB 375, and cites Comments 1-28 through 1-51 for examples.

Draft EIR Section 4.9, Land Use and Planning discusses regional regulations such as the SCAG RTP/SCS within Section 4.9.2, Relevant Plans, Policies, and Ordinances (Draft EIR page 4.9-4). Moreover, under Section 4.9.4, Impact Analysis, and Table 4.6-6, Project Consistency with the Connect SoCal (SCAG 2020-2045 RTP/SCS) within Section 4.6, Greenhouse Gas Emissions, of the Draft EIR analyzes the proposed Project's consistency with each goal identified within the SCAG RTP/SCS (Draft EIR pages 4.9-11 through 4.9-12 and 4.6-33 through 4.6-37). However, this particular comment does not identify the aforementioned specific examples related to the analysis in the Draft EIR. Additionally, please see Responses to Comments 1-26 and 1-28 through 1-51, below, for more discussion.

1-24 In summary, this comment states the Draft EIR does not demonstrate consistency with State Housing Element law and cites provisions of the California Government Code and case law for background.

Draft EIR Section 4.9, Land Use and Planning discusses the City's General Plan and zoning regulations within Section 4.9.2, Relevant Plans, Policies, and Ordinances (Draft EIR pages 4.9-5 through 4.9-8). Moreover, under Section 4.9.4, Impact Analysis, Table 4.9-1, General Plan Consistency Analysis, outlines the applicable policies of the General Plan and analyzes the proposed Project's consistency with each applicable provision (Draft EIR pages 4.9-12 through 4.9-33). Applicable goals and policies of the City's Housing Element are identified and subsequent Project consistency analyses are detailed under Table 4.9-1 on Draft EIR pages 4.9-20 and 4.9-21. The comment does not identify specific examples of inconsistency within the Draft EIR's consistency analysis.

Additionally, the comment asserts the Draft EIR does not analyze consistency with the latest Regional Housing Needs Allocation (RHNA) and states the Project as proposed does not include affordable housing units. Moreover, the comment states the Draft EIR's provision for a future development agreement should be included within the Draft EIR's Project Description.

Section 4.11, Population and Housing, of the Draft EIR details Housing Element law and the City's 5th and 6th Cycle RHNA allocation. Chapter 3, Changes to the Draft EIR, of the Final EIR revised the City's fair share allocation for the 2021-2029 RHNA planning period. As such, the comment correctly states the City's 6th Cycle RHNA allocation. However, the comment incorrectly asserts Draft EIR page 4.11-6 as the latest RHNA allocation. At the time of drafting the Draft EIR (February 2021), the City's 5th Cycle RHNA allocation was identified and discussed since this RHNA planning period ended in October 2021. In anticipation of the 6th Cycle, the Draft EIR includes Table 4.11-7, SCAG's 6th Cycle Estimate of RHNA Allocation based on Approved RHNA Methodology (Draft EIR page 4.11-10) and analyzes the Project's contribution to the current planning period in Section 4.11.4, Impact Analysis (Draft EIR page 4.11-17).

Lastly, as described in Chapter 3, Project Description, of the Draft EIR, the Project proposes 263 new housing units. Section 3.3.8, Development Agreement, further states (as the comment indicates) that the Project would provide benefits including some provision of affordable housing in return for a proposed Development Agreement between the City and the Applicant. Moreover, the Draft EIR states "[t]he full benefits will be negotiated between the parties but will not create any environmental impacts"

(Draft EIR page 3-17). As shown above, the Draft EIR adequately analyzes Project consistency with the City's Housing Element and demonstrates the addition of 263 new units would contribute to the City's RHNA allocation for the 6th Cycle (which started in October 2021). Furthermore, the affordable housing provision is outside the scope of CEQA. Per Section 15064(e) of the State CEQA Guidelines, "economic and social changes resulting from a project shall not be treated as significant effects on the environment." No changes to the Draft EIR's project description or environmental analyses are required. For informational purposes only, the Development Agreement (proposed at the time of drafting these Responses to Additional Comments) is comprised of a total of 32 affordable housing units (12% of the total housing units), including 1 very-low income unit and 14 low income units within PCC South, and 2 very-low income units and 15 low income units in PCC North.

1-25 In summary, this comment requests for the Project's denial and to revise and recirculate the EIR to address the aforementioned concerns.

The commenter's general opposition to the Project will be provided to the City's decision makers for their review and consideration. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

Response 1-26 is for "Exhibit A of A, March 8, 2021 SWAPE Letter to Mitchell M. Tsai"

1-26 In summary, the commenter states that by implementing a local hire provision requiring 10-mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips.

This comment is interpreted to be a request that the City implement a "local hire" requirement on the proposed Project, citing benefits to greenhouse gas, air quality, and transportation impacts through decreased trip lengths. As stated in Draft EIR Sections 4.2, Air Quality, 4.6, Greenhouse Gas Emissions, and Section 4.13, Transportation, there are no significant short-term construction-related or long-term operational environmental impacts that are related to the length of vehicle trips or the proximity of workers to the Project site. CalEEMod was used to calculate the annual GHG emissions based on the construction scenario described in Section 4.6.3, Thresholds of Significance. Construction of the proposed Project was anticipated to commence in October 2021 and reach completion in July 2024, lasting a total of 34 months.[1] On-site sources of GHG emissions include off-road equipment and off-site sources including haul trucks, vendor trucks, and worker vehicles. Overall, the Project was estimated to result in approximately 1,977 MT CO_2e per year and 66 MT CO_2e amortized over 30 years consistent with SCAQMD guidance, which states that construction emissions should be amortized over 30 years (SCAQMD 2008). Thus, the GHG analysis adds amortized construction emissions to the estimated annual operational emissions and then compares operational emissions to the proposed SCAQMD threshold of 3,000 MT CO_2e per year. As presented on Table 4.6-4 of the EIR, the Project's GHG emissions associated with development of the proposed Project would be 2,921 MT CO_2e, which is below the SCAQMD GHG threshold of 3,000 MT CO_2e per year. No changes to the Draft EIR are required and additional mitigation measures are not required to reduce GHG emissions. Therefore, there is no obligation under CEQA to consider implementation of skilled and trained workforce requirements, and no changes to the EIR are required.

[1] As explained in Section 4.2 of the Draft EIR, October 2021 represents the earliest possible start date. In practice, construction may begin at a later date. However, using an earlier start date for construction represents the worst-case scenario construction impacts, because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles.

Response 1-27 is for "Exhibits B and C of A, Curriculum Vitae for Paul Rosenfeld and Matt Hagemann"

1-27 This comment represents the curriculum vitae of Paul Rosenfeld, Ph.D., and Matt Hagemann, P.G., C.Hg. The comment does not express any environmental comments or concerns related to the environmental analysis in the Draft EIR. No response is required.

Responses 1-28 to 1-50 are for "Exhibit D of A, SWAPE Letter to Greg Sonstein"

1-28 In summary, the comment states that the Draft EIR fails to adequately evaluate the Project's air quality, health risk, and GHG impacts.

The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

1-29 In summary, the comment states that changes to the default modeling inputs in the CalEEMod modeling were incorrect and questions the estimated GHG emissions quantified in the Draft EIR and underlying assumptions included in the model.

As specifically identified in the California Emissions Estimator Model (CalEEMod) Version 2016.3.2 User's Tips documentation, "Users are encouraged to understand the defaults and provide site specific data (e.g., construction schedule, construction equipment type, results of traffic study, predicted water usage, etc.), if available, for a more accurate analysis" (CAPCOA 2017). As such, the changes to the default CalEEMod assumptions for the project emissions modeling were appropriate based on applicant input and project-specific information.

CalEEMod provides default values for input parameters such as for high-turnover restaurant, mid-rise apartments, and retail square footages. After the minimum project characteristic and land use information is inputted, CalEEMod provides default values so that the model may still be used to evaluate emissions from a land use development project in the event that such detailed information is not yet known (for instance, for a project in the planning stage). Similarly, CalEEMod provides a host of default values for the construction emissions analysis. Construction default values were utilized where Project information was not readily available. Default inputs that were updated according to information provided by the applicant include construction schedule phase lengths for major activities (e.g., demolition, grading, building construction, paving, and architectural coating); construction equipment lists for these major activities and hours of usage per day, construction truck and vehicle worker trips, and grading/excavation information. The construction methodology including information provided by the applicant are provided in the Draft EIR beginning on page 4.2-24 in Section 4.2.4, Approach and Methodology and beginning on page 4.6-26, Section 4.6.3, Approach and Methodology.

Project-specific information was applied to the CalEEMod model where appropriate and based on information obtained from the Project applicant regarding site-specific characteristics of the site and Project components. The Project applicant and their contractor(s) represent 'experts' in estimating construction activities for the Project based on their experience with similar projects and their need to estimate construction activities, such as duration of construction and equipment needed, for budgeting. Substantial evidence is defined in the CEQA statute to mean "facts, reasonable assumptions predicated on facts, and expert opinion supported by facts" (14 CCR 15384(b)). Because assumptions provided the Project applicant and their team represent an expert opinion supported by facts, these assumptions constitute substantial evidence under CEQA that can be used to more accurately estimate project-generated emissions.

Regarding operations, Project-specific data was used from the transportation analysis including the Project's trip generation rates for each land use type. The emissions estimates also assume compliance with regulations (state or local) are also taken into account for certain input variables such as compliance with building energy standards and utility renewable energy standards, as adopted by the State of California, some of which are not currently programmed into the model by default since many laws have been updated since the release of the model. Therefore, the use of Project-specific data in CalEEMod is appropriate and fully in line with the CalEEMod User's Guide and the Draft EIR's analysis is based on substantial evidence and is adequate as presented. No revisions to the Draft EIR are required.

Regarding the commenter's question about CalEEMod input consistency with the Draft EIR, please refer to Response to Comment 1-30.

1-30 In summary, the comment states that Appendix C-1 contains model inputs were not consistent with information disclosed in the Draft EIR, specifically that the CalEEMod land use inputs were not consistent with the project description land use metrics.

The minor discrepancy in the modeled inputs have been adjusted for the purpose of responding to this comment and are presented below. As shown, adjustments to CalEEMod have been conducted, which include revisions to the square footage as well as updates to the model. The Draft EIR CalEEMod inputs assumed 314,659 square feet of residential space, 11,000 square feet of commercial/retail space, and 763 parking spaces. The revised CalEEMod inputs assume 327,021 square feet of residential development, 11,252 square feet of commercial/retail uses, and 792 parking spaces.

At the time that the Project's Notice of Preparation (NOP) was released and the time that the analysis was prepared, the version of the CalEEMod was Version 2016.3.2 was the most appropriate and available model to use for the analysis. CalEEMod Version 2020.4.0 was released in June 2021. As with previous updates of CalEEMod, CalEEMod 2020.4.0 includes updates per current industry values and bug fixes. The key changes incorporated into CalEEMod 2020.4.0 were incorporating the CARB EMFAC 2017 update, including the Institute of Transportation Engineers 10th edition trip rates released in 2017, and incorporation of 2019 Title 24 Standards. The results of this re-run of CalEEMod to incorporate the minor discrepancies in the data inputs and the updated CalEEMod are shown below, in comparison to the results shown in the Draft EIR. As shown, the changes in the CalEEMod outputs are negligible when compared to the outputs in the Draft EIR and the significance thresholds. As such, the negligible changes in modeling results shown below are not substantive, do not change the analysis presented in the Draft EIR, do not result in new information, and do not require any revisions to the significance conclusions in the Draft EIR.

A portion of Table 4.2-9 from Section 4.2, Air Quality of the Draft EIR is repeated below and includes the estimated maximum daily construction emissions generated during construction of the proposed Project as assessed in the Draft EIR as well as the emissions generated by the updated CalEEMod analysis. Details of the updated emission calculations are provided in Appendix A to this document.

Additional Data for Draft EIR Table 4.2-9. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Maximum Construction Emissions	VOCs	NOx	CO	SOx	PM10	PM2.5
	Pounds per Day					
Draft EIR Maximum Daily Emissions	49.34	41.60	27.18	0.08	4.52	2.61
SCAQMD threshold	*75*	*100*	*550*	*150*	*150*	*55*
Threshold exceeded?	No	No	No	No	No	No
Updated Maximum Daily Emissions	49.05	41.22	27.73	0.07	4.52	2.62
Difference	(0.29)	(0.38)	0.55	(0.01)	0.00	0.01
Threshold exceeded?	No	No	No	No	No	No

Notes:
VOCs = volatile organic compounds; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.
Emissions noted in parentheses represents a negative number.

A portion of Table 4.2-10 from Section 4.2, Air Quality of the Draft EIR is repeated below and includes the maximum daily area, energy, and mobile source emissions associated with operation (Year 2025) of the proposed Project as assessed in the Draft EIR as well as the emissions estimated in the updated CalEEMod analysis. Details of the updated emission calculations are provided in Appendix A to this document.

Additional Data for Draft EIR Table 4.2-10. Estimated Maximum Daily Operational Criteria Air Pollutant Emissions

Total Operational Emissions	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
Draft EIR Project Total	11.47	19.12	53.79	0.15	10.52	3.25
SCAQMD Threshold	*55*	*55*	*550*	*150*	*150*	*55*
Threshold Exceeded?	No	No	No	No	No	No

LST exceeded?	No	No	No	No
Updated Construction Emissions	27.52	18.24	1.58	1.23

Additional Data for Draft EIR Table 4.2-11. Localized Significance Thresholds Analysis for Project Construction

Maximum On-Site Emissions	NO_2	CO	PM_{10}	$PM_{2.5}$
	Pounds per Day			
Difference	(12.98)	(2.91)	(1.58)	(1.21)
LST exceeded?	**No**	**No**	**No**	**No**

Notes:
NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.
Emissions noted in parentheses represents a negative number.

A portion of Table 4.6-3 from Section 4.6, Greenhouse Gas Emissions of the Draft EIR is repeated below and includes the construction GHG emissions for construction activities of the proposed Project as assessed in the Draft EIR as well as the GHG emissions generated by the updated CalEEMod analysis. Details of the updated emission calculations are provided in Appendix A to this document.

Additional Data for Draft EIR Table 4.6-3. Estimated Annual Construction Greenhouse Gas Emissions

Total Construction Emissions	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Draft EIR Project Total	**1,969.95**	**0.28**	**0**	**1,977.08**
Updated Construction Emissions	**1,851.36**	**0.26**	**0**	**1,877.17**
Difference	(118.59)	(0.02)	0	(99.91)

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrogen dioxide; CO_2e = carbon dioxide equivalent.
Emissions noted in parentheses represents a negative number.

A portion of Table 4.6-4 from Section 4.6, Greenhouse Gas Emissions of the Draft EIR is repeated below and includes the operational GHG emissions (including the amortized construction emissions) for operational activities of the proposed Project as assessed in the Draft EIR as well as the GHG emissions generated by the updated CalEEMod analysis. Details of the updated emission calculations are provided in Appendix A to this document.

Additional Data for Draft EIR Table 4.6-4. Estimated Annual Operational Greenhouse Gas Emissions

Total Operational Emissions	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Draft EIR Project Total	2,435.45	1.17	0.02	2,920.96
Updated Operational Emissions	**2,443.28**	**1.20**	**0.02**	**2,563.72**
Difference	7.83	0.03	0	(357.24)

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrogen dioxide; CO_2e = carbon dioxide equivalent.
Emissions noted in parentheses represents a negative number.

The proposed Project's construction health risk assessment (HRA) used the estimated annual construction exhaust PM_{10} emissions as a surrogate for diesel particulate matter (DPM), generated during construction of the Project. As presented in Additional Data for Draft EIR Table 4.2-9 above, the revised estimations of construction emissions indicate that PM_{10} emissions would not change compared to what was estimated in the Draft EIR. Therefore, the results of the HRA for the Project

would remain unchanged and the Project would result in a less than significant impact after implementation of mitigation measure MM-AQ-1.

As discussed in Section 4.4, Energy, of the Draft EIR, fuel consumption from construction equipment was estimated by converting the total CO_2 emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon. Furthermore, fuel consumption from mobile trips, during both construction and operations, was also estimated by converting the total CO_2 emissions from the construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. As presented in Additional Data for Draft EIR Tables 4.6-3 and 4.6-4 above, the revised CO_2 emissions generated during both construction and operations are expected to negligibly change compared to the CO_2 emissions estimated in the Draft EIR. Therefore, the petroleum consumption associated with the proposed Project would not be considered inefficient or wasteful and impacts would remain less than significant impact.

1-31 In summary, the comment states that the Draft EIR did not include the total amount of demolition haul trips required for the Project and claims that the default number of demolition hauling trips was underestimated by 431 trips.

CalEEMod provides default values for input parameters such as for high-turnover restaurant, mid-rise apartments, and retail square footages. After the minimum project characteristic and land use information is inputted, CalEEMod provides default values so that the model may still be used to evaluate emissions from a land use development project in the event that such detailed information is not yet known (for instance, for a project in the planning stage). Similarly, CalEEMod provides a host of default values for the construction emissions analysis. Construction default values were utilized where Project information was not readily available. Default inputs that were updated according to information provided by the applicant include construction schedule phase lengths for major activities (e.g., demolition, grading, building construction, paving, and architectural coating); construction equipment lists for these major activities and hours of usage per day, construction truck and vehicle worker trips, and grading/excavation information. The construction methodology including information provided by the applicant are provided in the Draft EIR beginning on page 4.2-24 in Section 4.2.4, Approach and Methodology and beginning on page 4.6-26, Section 4.6.3, Approach and Methodology.

Haul truck trips during the demolition phase was based on demolition and earthwork quantities provided by the Project's applicant. During Phase 1, it was assumed that 41,660 square feet of buildings and 6,000 square feet of pavement would require demolition. For Phases 2 and 3, it was assumed that a total of 131,000 square feet of pavement would require demolition. In order to estimate the number of haul trucks from pavement removal, CalRecycle's Construction/Demolition and Inert Debris Tools and Resources rate of 2,400 pounds per cubic yard of debris for asphalt was utilized. Assuming a depth of 4 inches and an area of approximately 3.01 acres of pavement to be removed would result in a volume of approximately 1,939 tons of debris. Therefore, Project was estimated to result in 200 one-way haul trips during the demolition phase of Phase 1. In addition, the Project would result in 200 one-way haul trips during the demolition subphase of Phase 2/3. The commenter states that the model should have included 178,660-square-feet of demolition, which is an incorrect assumption. CalEEMod estimates demolition trips based on the square footage of buildings to be demolished and/or the tons of debris to be removed. The commenter incorrectly summed the existing buildings square footage with the total pavement area, thus overstating the amount of haul trips

required for the demotion phase, since the commenter states the total demolition of building material would be 178,660-square-feet. Notably, pavement debris in CalEEMod is expressed as tons of debris, not square footage of the area. Therefore, no changes to the Draft EIR are required.

1-32 In summary, the comment states that the Draft EIR incorrectly estimates the grading acreage.

The Project's total acres of grading was accurately estimated in CalEEMod, which is based on Project site specific information. As discussed in Section 3.1, Project Description of the Draft EIR, the total site includes 6.23 acres, which includes the developed hotel properties. As such, 3.88 acres would be subject to grading/construction activities for Phases 1 and 2/3. Contrary to the commenter's assertion, the text included from the CalEEMod User Guide does not demonstrate an insufficiency regarding the analysis presented in the Draft EIR. The total net acreage to be graded of 3.88 acres, as provided by the proposed Project applicant, was used to determine the total area to be graded during each grading phase of the proposed Project. The text emphasized by the commenter appears to expressly condone the use of the total area to be graded as a means of determining the amount of grading needed on the site. Furthermore, each grading phase (Phase 1 and 2/3) is assumed to occur over two months, with multiple pieces of construction equipment working within each of the sites for the duration of the proposed Project's construction. Two-month grading period for each phase with multiple pieces of equipment working within the site, represents a reasonable, if not conservative, approach to analysis for grading a total of 3.88 acres. Therefore, the model was updated based on site specific information provided by the proposed Project applicant and no changes to the Draft EIR are required.

1-33 In summary, the comment states that the Draft EIR incorrectly makes adjustments to the material moisture content contained in the model.

The default values in CalEEMod model for the road dust (e.g., material silt content, material moisture content, and mean vehicle speed) are statewide averages used in the EPA's AP-42 methods for calculating fugitive dust emissions from paved and unpaved roads. Users are able to override the defaults in CalEEMod if data specific to the project is known. Furthermore, local jurisdictions can also provide guidance to users as to what default properly reflects known regional road dust parameters. The proposed Project site is underlain by quaternary Dune Sand deposits, Appendix E of the Draft EIR. It was determined that the proposed Project site is likely to be underlain by similar subsurface sandy materials with a thin cap of artificial fill. Overall, the underlying soils are likely to be comprised of Dune Sand deposits, which has a high concentration of sand that gives them a gritty feel, with varying amount of silt and clay materials that should be slightly moist to moist and loose to very dense. Density is anticipated to increase with depth. The proposed Project would be required to comply with the provisions in SCAQMD Rule 403 to prevent, reduce or mitigate fugitive dust emissions from each grading site. SCAQMD Rule 403 restricts visible fugitive dust to the project property line, restricts the PM10 emissions to less than 50 micrograms per cubic meter (µg/m3) and restricts the tracking out of bulk materials onto public roads. Additionally, the proposed Project will utilize one or more of the best available control measures (identified in the tables 1 and 2 of the rule), which may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering of all active sites periodically, maintaining moisture content of exposed soils, using chemical stabilizers and/or ceasing all activities during periods of high wind. Furthermore, the geotechnical due-diligence report indicated that the maximum moisture content of soils sampled was approximately 16.9%. In addition, the percentage of silt in CalEEMod was adjusted based on the UC Davis Soil Resource Laboratory for the Project area. The interactive tool allows for the identification of U.S. Department of Agriculture-National

Cooperative Soil Survey (USDA-NCSS) soil survey data for locations throughout the State. Soils within the Project area would be comprised of approximately 3.7% clay and 93% sand, with the remainder being silt. Therefore, the model was updated based on site specific information the applied moisture content of exposed soils and the excavation materials silt characteristics provided included in the geotechnical due-diligence report by the proposed Project applicant in order to reduce fugitive dust emissions during all graining and earthwork activities per SCAQMD Rule 403. Therefore, the model was updated based on site specific information provided by the proposed Project applicant and no changes to the Draft EIR are required.

1-34 In summary, the comment states that the Draft EIR incorrectly makes adjustments to the material silt content contained in the model.

Please see Responses to Comment 1-33.

1-35 In summary, the comment states that the Draft EIR incorrectly makes adjustments to the haul trips contained in the model. The number of hauling trips was collectively reduced by 386 trips, from the cumulative default value of 2,506 trips to 2,120 trips.

The Project's demolition and total acres of grading was accurately estimated in CalEEMod, which is based on Project site specific information provided by the proposed Project applicant. Overall, the proposed Project would result in the grading of 3.88 acres. Construction worker estimates and vendor truck trips by construction phase were based on information provided by the Project applicant. Haul truck trips during the demolition and grading phases were based on demolition and earthwork quantities provided. During Phase 1, it was assumed that 41,660 square feet of buildings and 6,000 square feet of pavement would require demolition. For Phases 2 and 3, it was assumed that a total of 131,000 square feet of pavement would require demolition. Grading is estimated to involve 17,700 cubic yards of soil for export, which would be required for Phase 2. Per information provided by the applicant, the Project was assumed to use haul trucks with a capacity of 20 cubic yards during grading/excavation activities. Therefore, Project was estimated to result in 200 one-way haul trips during the demolition phase of Phase 1. In addition, the Project would result in 200 and 1,720 one-way haul trips during the demolition and grading subphases of Phase 2/3. The commenter states that the model should have included at least 178,660-square-feet of demolition, which is an incorrect assumption (refer to Response to Comment 1-31). CalEEMod estimates demolition trips based on the square footage of buildings to be demolished and/or the tons of debris to be removed. The commenter incorrectly summed the existing buildings square footage with the total pavement area, thus overstating the amount of haul trips required for the demotion phase, since the commenter states the total demolition of building material would be 178,660 square feet. Therefore, no changes to the Draft EIR are required.

1-36 In summary, the comment states that the Draft EIR fails to mention or justify the changes to the construction related architectural coating areas.

The CalEEMod model assumed the default architectural exterior and interior square footages as presented in Appendix C-1 of the Draft EIR. CalEEMod however assumes that the Project's total square footage (325,659 square feet of buildings and 317,850 square feet of parking area) would undergo application of architectural coatings for both Phases 1 and Phases 2/3 concurrently, thus overestimating emissions of volatile organic compounds (VOCs). Therefore, in order to correctly

estimate the application of architectural coatings for both Phase 1 and Phases 2/3, the default exterior and interior square footages were utilized in the model which was reallocated based on the specific development undertaken during Phase 1 and Phases 2/3. As previously discussed, Phase 1 would include development of 3,273 SF of retail and 187 parking spaces; Phase 2 would include development of 120 dwelling units (146,550 SF), 2,056 square feet of retail and 3,700 square feet of restaurant, and 336 parking spaces; and Phase 3 would include development of 143 dwelling units (176,039 SF), 2,223 square feet of retail, and 240 parking spaces. Thus, the interior and exterior architectural square footages used in CalEEMod reflect the specific land use quantities inputted in the land use section of CalEEMod but adjusted for the specific construction phases (Phase 1 and Phases 2/3). Therefore, no changes to the Draft EIR are required.

1-37 In summary, the comment states that the air quality and GHG emissions modeling underestimates the number of weekday and Sunday trips during operations.

The proposed Project's trip generation from Section 4.13, Transportation of the Draft EIR, indicated that the overall trips generated from operations would be 2,517 weekday trips. The CalEEMod data was based on 2,507 trips and has been updated for the purpose of this response, as demonstrated in Response to Comment 1-29, which reflects that the proposed Project would generate approximately 2,517 trips. The air quality and GHG emission calculations modeling were revised as presented in Tables 4.2-10 and Table 4.6-4. Furthermore, the commenters assertion that weekday and Sunday trips were underestimated are incorrect. The Saturday and Sunday trip generation rates were adjusted based on the default proportions allocated in CalEEMod, based on the weekday trip generation rates presented in Table 4.13-1 of Section 4.13, Transportation. As presented in Table 4.2-10 and 4.6-4, the proposed Project-generated criteria air pollutant and GHG emissions would minimally change compared to the output presented in the Draft EIR, assuming the same trip generation from Section 4.13, Transportation. Details of the updated emission calculations are provided in Appendix A to this document.

1-38 In summary, the comment states that the air quality and GHG emissions modeling included unsubstantiated changes to the default energy use values, and the model may underestimate the Project's energy-source operational emissions.

Page 4.2-28 of Section 4.2 discusses that the input parameters were adjusted in good faith in compliance with the 2019 Title 24 standards since CalEEMod Version 2016.3.2 assumes compliance with the 2016 Title 24 standards. The 2019 Title 24 standards are the currently applicable building energy efficiency standards that became effective on January 1, 2020. As discussed in Section 4.2, Air Quality (page 4.2-28), the California Energy Commission (CEC) Impact Analysis for the 2019 Update to the California Energy Efficiency Standards for Residential and Non-Residential Buildings, the first-year savings for newly constructed non-residential buildings, are 197 gigawatt hours of electricity, 76.6 megawatts of demand, and 0.27 million therms of gas, representing reductions from the 2016 Title 24 standard of 10.7%, 9%, and 1%, respectively. The first-year savings for multi-family buildings are 91 gigawatt hours, 4.1 megawatts of demand, and 0.25 million therms of gas. On a percent savings basis compared to the 2016 standards, the multi-family, savings are 2% of electricity, 8% of demand and 5% of gas. Furthermore, the 2022 Title 24 standards are under development. The 2022 standards focus on four key areas in new construction: encouraging electric heat pump technology and use; establishing electric-ready requirements when natural gas is installed; expanding solar photovoltaic system and battery storage standards; and, strengthening ventilation standards to improve indoor air quality. In August 2021, the CEC adopted the 2022 standards; but, before those standards can become effective,

they must be approved by the California Building Standards Commission. If approved, the 2022 Title 24 standards will go into effect on January 1, 2023. Therefore, the Project would likely need to meet the more stringent 2022 standards. Therefore, no changes to the Draft EIR are required.

1-39 In summary, the comment states that the air quality and GHG emissions modeling included unsubstantiated changes to the default wastewater treatment system percentages. The model assumes that the Project's wastewater would be treated 100% aerobically. The commenter states that the use of 100% aerobic wastewater treatment percentages in the model is incorrect.

As shown on Page 44, Appendix A, Calculation Details for CalEEMod solids produced from aerobic processes are digested in anaerobic digesters; thus, anaerobic facilities are assumed in the CalEEMod aerobic wastewater treatment process (CAPCOA 2017). Furthermore, the wastewater treatment system assumptions are used by CalEEMod to quantify the Project's GHG emissions associated with wastewater treatment. Therefore, no changes to the Draft EIR are required.

1-40 In summary, the comment states that the air quality emissions modeling included these measures, based solely on the Project's compliance with SCAQMD Rule 403, is unsubstantiated.

The proposed Project would be required to comply with SCAQMD Rule 403 to control dust emissions generated during the grading activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering of the active sites three times per day depending on weather conditions which was reflected in the modeling's "mitigated" output which would result in a 55% reduction in fugitive dust emissions. As discussed in Section 4.2, Air Quality, of the Draft EIR (page 4.2-14), the Project would be required to comply with all applicable SCAQMD Rules and Regulations, including, but not limited to, Rule 401 (Visible Emissions), Rule 402 (Nuisance), and Rule 403 (Fugitive Dust). Compliance with these rules would minimize fugitive dust generated during Project construction to the maximum extent practical. Therefore, no changes to the Draft EIR are required.

1-41 In summary, the comment states that the CalEEMod operational mitigation measures included in the model are incorrect and may underestimate the Project's operational emissions.

In order to capture the traffic reductions based on the Project's site-specific location, the report on Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures was utilized. It is primarily focused on the quantification of project-level mitigation of GHG emissions associated with land use, transportation, energy use, and other related project areas. The Project would, improve the pedestrian network, this measure will increase the sidewalk coverage to improve pedestrian access. Providing sidewalks and an enhanced pedestrian network encourages people to walk instead of drive; improve transit access, the proposed Project would provide new living and working opportunities in close proximity to transit, thereby increasing ridership. Public transit that operates in the vicinity of the Project site includes the Metro C Line (formerly Green Line) and multiple bus lines. The Metro C Line is a light rail line running between Redondo Beach and Norwalk, with the closest station approximately 0.51-mile east of the Project site. There are two Metro bus lines, one Beach Cities bus line, and two Los Angeles Department of Transportation (LADOT) Commuter Express lines that run in the vicinity of the Specific Plan area (Metro Line 232; Metro Line 625; Beach Cities Line 109; LADOT Commuter Express 438; and LADOT Commuter Express 574); and would be located in an area with high destination accessibility, the Project site is located within an urbanized portion of the County of Los Angeles with access to housing and employment.

The commenter also states that the water reduction measures applied in CalEEMod was incorrect. The 20x2020 Water Conservation Plan sets forth a statewide road map to maximize the state's urban water efficiency and conservation opportunities between 2009 and 2020, and beyond. It aims to set in motion a range of activities designed to achieve the 20% per capita reduction in urban water demand by 2020. These activities include improving an understanding of the variation in water use across California, promoting legislative initiatives that incentivize water agencies to promote water conservation, and creating evaluation and enforcement mechanisms to assure regional and statewide goals are met. Furthermore, the Project would be required to meet the California Green Building Standards Code, also called the "CALGreen Code." As mandated by law, California buildings must reduce the maximum flow of water by 20% on all plumbing fittings and fixtures. Therefore, a 20% reduction in water usage was applied in CalEEMod in compliance with the CALGreen Code and state water reduction goals.

This commenter also states that the Draft EIR's GHG analysis incorrectly assumes reductions associated with solid waste emissions. The Draft EIR's assumption that the Project would reduce the amount of solid waste that would be landfilled by 50% was based on mandatory compliance with AB 939, AB 341, and AB 1826 (as discussed in Section 4.6, Greenhouse Gas Emissions). The Project would also provide storage areas for recyclables and green waste, as well as food waste storage. Therefore, the Project would comply with AB 939, AB 341, and AB 1826 would ensure that the anticipated solid waste reductions are realized. Therefore, no changes to the Draft EIR are required.

1-42 In summary, the comment states that the Draft EIR diesel particulate matter health risk emissions are inadequately evaluated and their screening-level construction HRA indicates a potentially significant impact.

Regarding the commenter's assertion the construction HRA relies upon a flawed air model, and as discussed in Response to Comments 1-29 through 1-35, the CalEEMod User's Tips documentation, "Users are encouraged to understand the defaults and provide site specific data (e.g., construction schedule, construction equipment type, results of traffic study, predicted water usage, etc.), if available, for a more accurate analysis". As such, the changes to the default CalEEMod assumptions for project emissions modeling were appropriate based on applicant input and Project-specific information.

The commenter also states that the Draft EIR failed to evaluate the Project's operational health risk impacts. The Project would not result in a long-term source of TAC emissions. No residual TAC emissions and corresponding cancer risk are anticipated after construction, and no long-term sources of TAC emissions are anticipated during operation of the Project. Additionally, CARB has published the *Air Quality and Land Use Handbook: A Community Health Perspective* (CARB 2005), which identifies certain types of facilities or sources that may emit substantial quantities of TACs and therefore could conflict with sensitive land uses, such as "schools and schoolyards, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential communities." The *Air Quality and Land Use Handbook* is a guide for siting of new sensitive land uses, but it does not mandate specific separation distances to avoid potential health impacts. The enumerated facilities or sources include the following:

- High-traffic freeways and roads
- Distribution centers
- Rail yards
- Ports

- Refineries
- Chrome plating facilities
- Dry cleaners
- Large gas dispensing facilities.

The Project would not include any of the previously listed land uses and would not expose sensitive receptors to TAC emissions from these sources.

Regarding the commenter's assertion that health risk impacts from Project operation should also be evaluated, a 30-year exposure duration vastly exceeds the 6-month requirement set forth by Office of Environmental Health Hazard Assessment (OEHHA). As discussed in the construction HRA (Appendix C-2 of the Draft EIR), the construction HRA was performed in accordance with the OEHHA approved the 2015 Risk Assessment Guidelines Manual (OEHHA 2015). SCAQMD requires that all HRAs prepared for CEQA documents follow SCAQMD policies in conjunction with the 2015 Risk Assessment Guidelines Manual. For the purposes of the construction HRA, given the less-than-lifetime exposure period, and the higher breathing rates and sensitivity of children to construction-generated TACs, the cancer risk calculation assumes that the exposure would affect children early in their lives. For the residential health risk, the HRA assumes exposure would start in the third trimester of pregnancy and occur for 34 months, over the duration of construction activities.

Regarding the commenter's assertion of the incorrect application of construction-related mitigation and failure to adequately analyze health risks associated with DPM, the commenter uses a screening model, known as AERSCREEN, to evaluate health risk impacts from diesel emissions during construction of the proposed Project. While the AERSCREEN model is an acceptable model by the U.S. Environmental Protection Agency's (EPA) and SCAQMD, it is a screening model. As a screening model, it overestimates impacts with the general understanding that if AERSCREEN does not show impacts, then impacts would also not occur if a more detailed analysis is conducted using a more refined model. AERSCREEN is a simplified model in that it does not consider meteorological data or topographical data. AERSCREEN assumes calm wind conditions at all times and a stable atmosphere (i.e., no atmospheric mixing). AERSCREEN also has simplified emissions input fields such that it typically overestimates emission impacts from varying construction activities.

In addition, the SCAQMD does not have guidance requiring that construction and operational health risk be evaluated together. Based on an email from Michael Krause, Planning and Rule Manager with SCAQMD, who is an expert, a project's construction and operational health risks need to be evaluated separately. Thus, the construction HRA is analyzed in accordance with industry guidance and an operational HRA is not necessary.

Further, the comment states that the commenter prepared a screening-level health risk assessment using changed CalEEMod inputs with the assumption that health risks should be combined for construction and operation of the Project. The commenter has not provided any substantive comments that would alter model inputs or the findings of the emissions calculations in the Draft EIR. Construction health risks were evaluated in the Draft EIR using the EPA and SCAQMD refined model, known as American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD). This model takes into account meteorological data and topographical data. It also accounts for the geography of a project site, locations of emissions sources, the time of day emissions would occur, locations of sensitive receptors, and other factors to a much greater degree than AERSCREEN, which

better represents the real world environment. Based on the construction HRA using this refined model, AERMOD, using AERMOD methodologies from the SCAQMD, and using the age sensitivity factors and other health risk evaluation parameters recommended by the SCAQMD and the Office of Environmental Health Hazard Assessment (OEHHA), health risk impacts were determined to be less than the SCAQMD significance thresholds for cancer risk and non-cancer chronic risk for DPM after implementation of MM-AQ-1, which would require the use of Tier 4 interim equipment for all construction equipment greater than 75 horsepower.

The analysis was modeled to assume a construction start date of October 2021, which represented the earliest date of construction at the time the analysis was prepared, anticipating when air quality and GHG assessments would be initiated.[2] Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant and GHG emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. Tier 4 standards for engine horsepower between 11 horsepower and 75 horsepower were available starting in 2008. For engines with horsepower between 75 and 175, Tier 4 engines were available starting in 2012. For engine horsepower between 175 and greater than 1,200, Tier 4 engines were available starting in 2011. As such, equipment engines that meet Tier 4 emission standards are currently available at the time of this analysis, and would continue to be available during the Project's construction years (through 2024) (USEPA 2016).

Furthermore, an exemption from using Tier 4 equipment may be granted by the City of El Segundo if the Project proponent documents that equipment with the required tier is not reasonably available and provided corresponding reductions in criteria air pollutant emissions are achieved from other construction equipment. For example, if a Tier 4 Interim piece of equipment is not reasonably available at the time of construction and a lower tier equipment is used instead (e.g., Tier 3), another piece of equipment would be replaced with an alternative-fueled (not diesel-fueled) equipment to offset the emissions associated with using a piece of equipment that does not meet Tier 4 standards. As such, the use of the air quality modeling results is correct and is appropriately relied upon. The Draft EIR adequately evaluated the proposed Project's potential health risk impacts from construction and determined that they would be less than significant after implementation of MM-AQ-1.

Therefore, based on the above considerations the Draft EIR's health risk analysis is adequate as presented.

1-43 The commenter states that the Draft EIR's GHG analysis, as well as the subsequent less-than-significant impact conclusion is incorrect.

Please see the following Responses to Comments:

1) The Draft EIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model; Please refer to Responses to Comments 1-29 through 1-41.

2) The Draft EIR's quantitative GHG analysis relies upon an outdated threshold; Please refer to Response to Comment 1-45.

[2] As explained in Section 4.2 of the Draft EIR, October 2021 represents the earliest possible start date. In practice, construction may begin at a later date. However, using an earlier start date for construction represents the worst-case scenario construction impacts, because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles.

3) The Draft EIR's unsubstantiated air model indicates a potentially significant impact; Please refer to Response to Comment 1-46.

4) The Draft EIR fails to consider the performance-based standards under CARB's Scoping Plan; Please refer to Response to Comment 1-47.

5) The Draft EIR fails to consider the performance-based standards under SCAG's RTP/SCS; Please refer to Response to Comment 1-48.

1-44 The commenter states that the modeling underestimates the Project's emissions, and the Draft EIR's quantitative GHG analysis should not be relied upon to determine Project significance.

Please see Responses to Comments 1-29 through 1-41.

1-45 The commenter states that the Draft EIR incorrectly applies the GHG threshold of 3,000 MT CO2e per year.

Regarding the commenters assertion that the Draft EIR used an outdated quantitative GHG threshold, the South Coast Air Quality Management District (SCAQMD) formed a GHG CEQA Significance Threshold Working Group to work with SCAQMD staff on developing GHG CEQA significance thresholds until statewide significance thresholds or guidelines are established. From December 2008 to September 2010, the SCAQMD hosted working group meetings and revised the draft threshold proposal several times, although it did not officially provide these proposals in a subsequent document. The SCAQMD has continued to consider adoption of significance thresholds for residential and general land use development projects. The most recent proposal, issued in September 2010, uses the following tiered approach to evaluate potential GHG impacts from various uses (SCAQMD 2010):

Tier 1 Determine if CEQA categorical exemptions are applicable. If not, move to Tier 2.

Tier 2 Consider whether or not the project is consistent with a locally adopted GHG reduction plan that has gone through public hearing and CEQA review, that has an approved inventory, includes monitoring, etc. If not, move to Tier 3.

Tier 3 Consider whether the project generates GHG emissions in excess of screening thresholds for individual land uses. The 10,000 metric tons (MT) of carbon dioxide equivalent (CO_2e) per year threshold for industrial uses and stationary projects would be recommended for use by all lead agencies. Under option 1, separate screening thresholds are proposed for residential projects (3,500 MT CO_2e per year), commercial projects (1,400 MT CO_2e per year), and mixed-use projects (3,000 MT CO_2e per year). Under option 2, a single numerical screening threshold of 3,000 MT CO_2e per year would be used for all non-industrial projects. If the project generates emissions in excess of the applicable screening threshold, move to Tier 4.

Tier 4 Consider whether the project generates GHG emissions in excess of applicable performance standards for the project service population (population plus employment). The efficiency targets were established based on the goal of AB 32 to reduce statewide GHG emissions to 1990 levels by 2020. The 2020 efficiency targets are 4.8 MT CO_2e per service population for project level analyses and 6.6 MT CO_2e per service population for plan level analyses. If the project generates emissions in excess of the applicable efficiency targets, move to Tier 5.

Tier 5 Consider the implementation of CEQA mitigation (including the purchase of GHG offsets) to reduce the project efficiency target to Tier 4 levels.

Based on the supporting analysis outlined in SCAQMD's draft GHG guidance and meeting notes, this 3,000 MT CO_2e per year level would capture 90% of GHG emissions from new residential or commercial projects in the region (SCAQMD 2008). This type of market capture analysis captures a substantial fraction of the GHG emissions from future development to accommodate for future population and job growth and excludes small development projects that would contribute a relatively small fraction of the cumulative statewide GHG emissions.

Therefore, the Draft EIR relies on use of the 3,000 MT CO_2e per year threshold because it has been recommended by SCAQMD and SCAQMD is an expert agency in the region. Furthermore, the SCAQMD provides substantial evidence that the thresholds are consistent with policy goals and 2050 GHG emissions reduction targets set by the State. Specifically, the thresholds were set at levels that capture 90% of the GHG emissions form the above-described uses, consistent with Executive Order (EO) S-3-05 target of reducing GHGs to 80% below 1990 levels by 2050. No changes to the Draft EIR are required.

1-46 The commenter states that the Draft EIR would result in potentially significant GHG emissions exceeding the 2030 "Substantial Progress" threshold of 660 MT CO_2e per service population per year and AEP's "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e per service population per year.

Overall, the CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific quantitative thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). State CEQA Guidelines Section 15064.4 states that a lead agency shall make a good-faith effort, based on available information, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. A lead agency has the discretion to determine, in the context of a particular project, whether to: (1) use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use, or (2) rely on a qualitative analysis or performance based standards. The City appropriately applied their discretion to apply a numeric GHG threshold recommended by the SCAQMD and is not required to apply alternative thresholds as recommended by the commenter. Regarding the commenters assertion that the Project would result in significant GHG emissions, as presented in Table 4.6-4 of Section 4.6, Greenhouse Gas of the Draft EIR, GHG emissions associated with development of the proposed Project would be below the SCAQMD GHG threshold of 3,000 MT CO_2e per year, with the Project resulting in approximately 2,921 MT CO_2e per year. Response to Comments 29 through 49 discusses the adequacy of the utilized CalEEMod input parameters.

1-47 In summary, the comment states that their modeling indicates that the Project's VMT would exceeds the CARB 2017 Scoping Plan projections for 2010, 2025, and 2030.

CARB released the updated Mobile Source Strategy that demonstrates how the State can simultaneously meet air quality standards, achieve 2030 and 2050 GHG emission reduction targets, decrease health risk, and reduce petroleum consumption from the transportation sector. CARB developed a scenario-based modeling system that was used to identify foreseeable emission reductions associated with existing mobile-source regulations, and to explore different combinations

of further advancements in technologies, fuels, and transportation system efficiencies. This modeling usefully relates VMT and GHG metrics to each other, and can be a useful source of information for planners considering projects using one or the other of these metrics. Specifically, in support of the Mobile Source Strategy, CARB developed two scenarios using the model that are particularly relevant with respect to GHG emissions from the transportation sector. Notably, the baseline scenario represents the mobile-source GHG emissions reductions associated with existing mobile-source controls, regulations, foreseeable deployment of technology, and current projections of VMT included in the existing RTP/SCSs adopted by the State's 18 Metropolitan Planning Organizations (MPOs) pursuant to SB 375. Furthermore, the Cleaner Technologies and Fuels (CTF) scenario evaluates what level of additional deployment of cleaner vehicle technologies and fuels combined with slower growth in VMT would be necessary to achieve state air quality targets and climate goals of 40% reduction in GHG emissions from 1990 levels by 2030 and 80% by 2050. The existing total VMT per capita (2015-2018 average) was 24.6 and the existing light-duty VMT per capita (2015-2018 average) was 22.2.

As presented in Section 4.13, Transportation, the daily household VMT per capita for the Project -was determined by using the SCAG 2016 RTP/SCS travel demand model (SCAG 2016). The SCAG travel demand model identifies trip purposes as Home-Based Work and Home-Based Other, where trips have been produced by residential land uses and trips have been attracted by nonresidential land uses. The other trip type, Non-Home-Based, is produced and attracted by nonresidential land uses. The average trip length and vehicle trips for all Home-Based Work and Home-Based Other productions are used to calculate the daily household VMT per capita for residential uses.

Residential is already an existing land use in the Transportation Analysis Zones (TAZ) located in the City in which the Project is located, and the model therefore includes residential trips and average trip lengths. It is assumed that the Project's residential trips would have the same characteristics as the existing residential trips in the zone. The VMT per capita assumed for the Project site was therefore based on the vehicle trips and average trip lengths for the TAZ in which the Project is located from the SCAG model, which indicates a daily household VMT per capita of 10.9 for all home-based production trips within the TAZ, which is 23% below the City's VMT of 14.2. As such, the proposed Project's daily household VMT would not conflict with the transportation assumptions embedded in the 2017 Scoping Plan and with 2050 State climate goals. Therefore, no changes to the Draft EIR are required and impacts would remain less than significant.

1-48 In summary, the comment states that the Draft EIR does not consider performance-based goals under SCAG's RTP/SCS and SB 375 (e.g., per capita emission targets or VMT per capita benchmarks).

State CEQA Guidelines Section 15064.4 states that a lead agency should make a good-faith effort, based on available information, to describe, calculate or estimate the amount of GHG emissions resulting from a project. A lead agency has the discretion to determine, in the context of a particular project, whether to: (1) use a model or methodology to quantify GHG emissions resulting from a project, and which model or methodology to use; or (2) rely on a qualitative analysis or performance-based standards. As discussed in the Draft EIR, the City has not adopted quantitative project-level significance thresholds for assessing impacts related to GHG emissions applicable to the proposed Project, therefore, the SCAQMD threshold of 3,000 MT CO_2e was used to assess the Project's GHG emissions as discussed above.

As discussed in Section 4.13, Transportation of the Draft EIR, as the City has not yet adopted new transportation impact study guidelines including the VMT metric and significance criteria in compliance with Senate Bill (SB) 743 guidelines, the impact thresholds used for this Project are based on the Governor's Office of Planning and Research (OPR) guidelines. The proposed Project is estimated to generate 10.9 daily household VMT per capita, which is lower than 15% below the existing City daily household VMT per capita, and the Project was determined to have a less-than-significant VMT impact. Given the less than significant VMT impact, the GHG emissions from per capita VMT associated with the Project are assumed to be consistent with the VMT goals of the 2017 Scoping Plan and SCAG's 2020-2045 RTP/SCS. Furthermore, Impact GHG 4.6b evaluates the consistency of the Project with plans adopted for the purpose of reducing GHG emissions separate from the quantitative analysis. The Project is found to be consistent with the applicable regulatory plans and policies to reduce GHG emissions, including the emissions reduction measures discussed within 2017 Scoping Plan, Assembly Bill (AB) 32, EO S-3-05 and B-30-15, and SCAG's 2020-2045 RTP/SCS. The Specific Plan allows land use designations which creates a mix of land uses that are within walking distance of one another, and introduces retail uses along the Pacific Coast Highway (PCH) to provide streets that are attractive to pedestrians. The Project would promote healthy, walkable communities. Therefore, if the Project would not conflict with these plans, the City would be able to achieve its GHG reduction goals, and, therefore, these plans can be used at a Project level to show that a project would not have a significant cumulative effect on the environment as it relates to GHG impacts.

As the substantial evidence provided on pages 4.6-29 through 4.6-46 of Section 4.6, Greenhouse Gas Emissions, of the Draft EIR shows, the Project would be consistent with the applicable provisions of these plans. Therefore, the Draft EIR properly concludes, based on substantial evidence, that the Project's GHG impacts are less than significant and mitigation measures are not required.

1-49 In summary, the comment states that the Project would result in potentially significant health risk and GHG impacts that should be mitigated further, thus, the Project should incorporate the mitigation measures provided.

Please see Responses to Comment 1-42.

Additionally, it is important to note, CEQA does not require adoption of every imaginable feasible mitigation measure. CEQA's requirement applies only to feasible mitigation that will "substantially lessen" a project's significant effects. (Public Resources Code, § 21002.) As explained by one court: A lead agency's "duty to condition project approval on incorporation of feasible mitigation measures only exists when such measures would [avoid or] 'substantially lessen' a significant environmental effect." (San Franciscans for Reasonable Growth v. City and County of San Francisco (1989) 209 Cal.App.3d 1502, 1519.) "Thus, the agency need not, under CEQA, adopt every nickel and dime mitigation scheme brought to its attention or proposed in the project EIR." (Ibid.) Rather, an EIR should focus on mitigation measures that are feasible, practical, and effective. (Napa Citizens for Honest Government v. Napa County Board of Supervisors (2001) 91 Cal.App.4th 342, 365.). Furthermore, as presented in Section 4.2, Air Quality, and Section 4.6, Greenhouse Gas Emissions, the proposed Project would not result in significant impacts requiring the need for additional mitigation.

1-50 In summary, this comment provides a generic disclaimer about the comment letter. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

Responses 1-51 through 1-52 are for "Attachments A through F of Exhibit D of A"

1-51 The commenter provided their own health risk, air quality, and GHG calculations to determine significance of the Project due to construction and operations. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

1-52 In summary, this comment provides the curriculum vitae of Paul Rosenfeld, Ph.D., and Matt Hagemann, P.G., C.Hg. The comment does not express any environmental comments or concerns related to the environmental analysis in the Draft EIR. No further response is required.

Response 1-53 is for "Exhibit B, April 12, 2021 SWRCC Letter"

1-53 This comment represents a copy of an email from the commenter to the City dated April 12, 2021 with a reference to an attachment. The City assumes the attachment is in reference to the aforementioned comments. No further response is provided.

Re: Comment on Final Environmental Impact Report, Pacific Coast Commons Specific Plan (SCH# 2020050508)

Dear Chair Baldino, Honorable Members of the Planning Commission, and Mr. Samaras:

I am writing on behalf of Supporters Alliance For Environmental Responsibility ("SAFER") regarding the Final Environmental Impact Report ("FEIR") prepared for the Project known as Pacific Coast Commons Specific Plan, aka SCH# 2020050508, including all actions related or referring to the proposed demolition of existing surface parking lots and construction of a new mixed use development located at 401-575 N. Pacific Coast Highway (PCH) and the parking lot on 600-block of PCH in the City of El Segundo ("Project").

After reviewing the FEIR, we conclude that the FEIR fails as an informational document, fails to adequately analyze the Project's environmental impacts, and fails to impose all feasible mitigation measures to reduce the Project's impacts. SAFER requests that the Planning Division address these shortcomings in a revised environmental impact report ("REIR") and recirculate the REIR prior to considering approvals for the Project.

This comment has been prepared with the assistance of Certified Industrial Hygienist, Francis "Bud" Offermann, PE, CIH (Exhibit A). Mr. Offermann's comments are incorporated herein by reference.

2-1

I. PROJECT DESCRIPTION

2-2

The Specific Plan area for this Project consists of eight parcels which total 6.385 gross acres. Current developments onsite include the Fairfield Inn and Suites Hotel and the

Aloft Hotel, as well as surface parking lots. The Project would redevelop existing surface parking lots and a portion of the Fairfield Inn and Suites Hotel and would create five new land use districts. The site is bounded by Los Angeles International Airport to the north and residential communities to the east and south.

The Specific Plan allows for the following: (1) the continued operation of the Fairfield Inn and Suites Hotel and Aloft Hotel, which contain 596 rooms within 288,767 square feet of hotel development; (2) 327,021 square feet of residential development for 263 new housing units, including 257 multi-family apartments and six condominium/ townhomes; (3) 11,252 square feet of new commercial/retail uses; and (4) three new parking structures that would contain approximately 792 parking stalls. Construction activities would last approximately 34 months.

2-2 Cont.

II. LEGAL BACKGROUND

CEQA requires that an agency analyze the potential environmental impacts of its proposed actions in an environmental impact report ("EIR") (except in certain limited circumstances). *See, e.g.* Pub. Res. Code § 21100. The EIR is the very heart of CEQA. *Dunn-Edwards v. BAAQMD* (1992) 9 Cal.App.4th 644, 652. "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." *Communities for a Better Environment v. Calif. Resources Agency* (2002) 103 Cal. App. 4th 98, 109.

CEQA has two primary purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 Cal. Code Regs. ("CEQA Guidelines") § 15002(a)(1). "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs.* (2001) 91 Cal. App. 4th 1344, 1354 ("*Berkeley Jets*"); *County of Inyo v. Yorty* (1973) 32 Cal.App.3d 795, 810.

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. CEQA Guidelines § 15002(a)(2) and (3); *see also, Berkeley Jets*, 91 Cal.App.4th at pp. 1344, 1354; *Citizens of Goleta Valley*, 52 Cal.3d at 564. The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or

2-3

significantly reduced." CEQA Guidelines §15002(a)(2). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." Pub. Res. Code § 21081; 14 Cal.Code Regs. § 15092(b)(2)(A) & (B). The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 732.

While the courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" *Berkeley Jets*, 91 Cal. App. 4th at p. 1355 (emphasis added) (quoting *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 391 409, fn. 12). As the court stated in *Berkeley Jets*:

> A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process." (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal. App. 4th 1109, 1117; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal. App. 4th 931, 946.)

2-3 Cont.

More recently, the California Supreme Court has emphasized that:

> When reviewing whether a discussion is sufficient to satisfy CEQA, a court must be satisfied that the EIR (1) includes sufficient detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issues the proposed project raises [citation omitted], and (2) makes a reasonable effort to substantively connect a project's air quality impacts to likely health consequences.

Sierra Club v. Cty. of Fresno (2018) 6 Cal.5th 502, 510 (2018), citing *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405. "Whether or not the alleged inadequacy is the complete omission of a required discussion or a patently inadequate one-paragraph discussion devoid of analysis, the reviewing court must decide whether the EIR serves its purpose as an informational document." *Sierra Club v. Cty. of Fresno*, 6 Cal.5th at 516. Although an agency has discretion to decide the manner of discussing potentially significant effects in an EIR, "a reviewing court must determine whether the discussion of a potentially significant effect is sufficient or insufficient, i.e., whether the EIR comports with its intended function of including 'detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" 6 Cal.5th at 516, citing *Bakersfield Citizens for*

Local Control v. City of Bakersfield (2004) 124 Cal.App.4th 1184, 1197. "The determination whether a discussion is sufficient is not solely a matter of discerning whether there is substantial evidence to support the agency's factual conclusions." 6 Cal.5th at 516. Whether a discussion of a potential impact is sufficient "presents a mixed question of law and fact. As such, it is generally subject to independent review. However, underlying factual determinations—including, for example, an agency's decision as to which methodologies to employ for analyzing an environmental effect—may warrant deference." *Sierra Club v. Cty. of Fresno*, 6 Cal.5th at 516. As the Court emphasized:

> [W]hether a description of an environmental impact is insufficient because it lacks analysis or omits the magnitude of the impact is not a substantial evidence question. A conclusory discussion of an environmental impact that an EIR deems significant can be determined by a court to be inadequate as an informational document without reference to substantial evidence.

Sierra Club v. Cty. of Fresno, 6 Cal.5th at 514. We find that the FEIR prepared by the City here is inadequate for the reasons set forth below.

2-3 Cont.

III. DISCUSSION

A. There is Substantial Evidence that the Project Will Have a Significant Health Risk Impact from its Indoor Air Quality Impacts.

Certified Industrial Hygienist, Francis "Bud" Offermann, PE, CIH, has conducted a review of the proposed Project and relevant documents regarding the Project's indoor air emissions. Indoor Environmental Engineering Comments (Exhibit A). Mr. Offermann concludes that it is likely that the Project will expose residents and commercial employees of the Project to significant impacts related to indoor air quality, and in particular, emissions of the cancer-causing chemical formaldehyde. Mr. Offermann is a leading expert on indoor air quality and has published extensively on the topic. Mr. Offermann's expert comments and curriculum vitae are attached as Exhibit A.

Mr. Offermann explains that many composite wood products used in building materials and furnishings commonly found in offices, warehouses, residences, and hotels contain formaldehyde-based glues which off-gas formaldehyde over a very long time period. He states, "[t]he primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims." Ex. A, p. 2-3.

2-4

Formaldehyde is a known human carcinogen. Mr. Offermann states that future residents of the Project would be exposed to a 120 in one million risk, assuming all materials are compliant with the California Air Resources Board's formaldehyde airborne toxics control measure. *Id.* at 4. As for commercial employees, he estimates an exposure level of 17.7 in one million. *Id.* at 5. These potential exposure level exceeds the South Coast Air Quality Management District's ("SCAQMD") CEQA significance threshold for airborne cancer risk of 10 per million.

Mr. Offermann concludes that these significant environmental impacts should be analyzed in the EIR and mitigation measures should be imposed to reduce the risk of formaldehyde exposure. *Id.* Mr. Offermann identifies mitigation measures that are available to reduce these significant health risks, including the installation of air filters and a requirement that the applicant use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins or ultra-low emitting formaldehyde (ULEF) resins in the buildings' interiors. *Id.* at 12.

Mr. Offermann also notes that because of the Project's close proximity to roads with moderate to high traffic and to air traffic from the nearby Los Angeles International Airport, the project is sound impacted. It will therefore require a "mechanical supply of outdoor air ventilation to allow for a habitable interior environment with closed windows and doors," so as to allow occupants the discretion to control exterior noise. *Id.* at 11.

2-4
Cont.

The City has a duty to investigate issues relating to a project's potential environmental impacts, especially those issues raised by an expert's comments. *See Cty. Sanitation Dist. No. 2 v. Cty. of Kern*, (2005) 127 Cal.App.4th 1544, 1597–98 ("under CEQA, the lead agency bears a burden to investigate potential environmental impacts"). In addition to assessing the Project's potential health impacts to residents and employees, Mr. Offermann identifies the investigatory path that the City should be following in developing an EIR to more precisely evaluate the Project's future formaldehyde emissions and establishing mitigation measures that reduce the cancer risk below the SCAQMD level. Such an analysis would be similar in form to the air quality modeling and traffic modeling typically conducted as part of a CEQA review.

The failure to address the project's formaldehyde emissions is contrary to the California Supreme Court's decision in *California Building Industry Ass'n v. Bay Area Air Quality Mgmt. Dist.* (2015) 62 Cal.4th 369, 386 ("*CBIA*"). At issue in *CBIA* was whether the Air District could enact CEQA guidelines that advised lead agencies that they must analyze the impacts of adjacent environmental conditions on a project. The Supreme Court held that CEQA does not generally require lead agencies to consider the environment's effects on a project. *CBIA*, 62 Cal.4th at 800-801. However, to the extent a project may exacerbate existing adverse environmental conditions at or near a project site, those would still have to be considered pursuant to CEQA. *Id.* at 801 ("CEQA calls upon an agency to evaluate

existing conditions in order to assess whether a project could exacerbate hazards that are already present"). In so holding, the Court expressly held that CEQA's statutory language required lead agencies to disclose and analyze "impacts on ***a project's users or residents*** that arise ***from the project's effects*** on the environment." *Id.* at 800 (emphasis added).

The carcinogenic formaldehyde emissions identified by Mr. Offermann are not an existing environmental condition. Those emissions to the air will be from the Project. Residents and commercial employees will be users of the Project. Rather than excusing the City from addressing the impacts of carcinogens emitted into the indoor air from the project, the Supreme Court in *CBIA* expressly finds that this type of effect by the project on the environment and a "project's users" must be addressed in the CEQA process.

The Supreme Court's reasoning is well-grounded in CEQA's statutory language. CEQA expressly includes a project's effects on human beings as an effect on the environment that must be addressed in an environmental review. "Section 21083(b)(3)'s express language, for example, requires a finding of a 'significant effect on the environment' (§ 21083(b)) whenever the 'environmental effects of a project will cause substantial adverse effects *on human beings*, either directly or indirectly.'" *CBIA*, 62 Cal.4th at 800 (emphasis in original). Likewise, "the Legislature has made clear—in declarations accompanying CEQA's enactment—that public health and safety are of great importance in the statutory scheme." *Id.*, citing e.g., §§ 21000, subds. (b), (c), (d), (g), 21001, subds. (b), (d). It goes without saying that the future residents and employees of the Project are human beings and the health and safety of those residents and workers is as important to CEQA's safeguards as that of other nearby residents currently living near the project site.

The City's EIR must disclose and mitigate the potential environmental impacts to future users of the building.

2-4 Cont.

B. There is Substantial Evidence that the Project will have Significant Adverse Air Quality, Health Risk, and Greenhouse Gas Impacts

1. The DEIR Relied on Unsubstantiated Input Parameters to Estimate Project Emissions and Thus the Project May Result in Significant Air Quality Impacts.

The Southwest Regional Council of Carpenters submitted a public comment on April 12, 2021 which was supported by the comments of expert environmental consulting firm SWAPE. (Exhibit B). Matt Hagemann, P.G., C.Hg., and Dr. Paul E. Rosenfeld, Ph.D., of the environmental consulting firm SWAPE reviewed the DEIR's analysis of the Project's impacts on air quality, health risk, and greenhouse gases. SAFER joins the Carpenters' comment and SWAPE's comment, the latter of which is incorporated by reference herein.

2-5

SWAPE found that the DEIR incorrectly estimated the Project's construction and operational emissions and therefore cannot be relied upon to determine the significance of the Project's impacts on local and regional air quality. The DEIR relies on emissions calculated from the California Emissions Estimator Version CalEEMod.2016.3.2 ("CalEEMod"). DEIR, p. 4.2-1. This model, which is used to generate a project's construction and operational emissions, relies on recommended default values based on site specific information related to a number of factors. SWAPE comment, p. 1. CEQA requires any changes to the default values to be justified by substantial evidence. *Id.* at 1-2.

SWAPE reviewed the DEIR's CalEEMod output files and found that the values input into the model were inconsistent with information provided in the DEIR. *Id.* at 2. As a result, the DEIR's air quality analysis cannot be relied upon to determine the Project's emissions.

Specifically, SWAPE found that the following values used in the DEIR's air quality analysis were either inconsistent with information provided in the DEIR or otherwise unjustified:

1. Underestimated Land Use Sizes. SWAPE comment, p. 2.
2. Failure to Model All Required Demolition. *Id.* at p. 3-4.
3. Unsubstantiated Changes to Acres of Grading Values. *Id.* at 4-5.
4. Unsubstantiated Changes to Material Moisture Content Bulldozing Values. *Id.* at 5-6.
5. Unsubstantiated Changes to Material Silt Content Values. *Id.* at 6-7.
6. Unsubstantiated Changes to Hauling Trip Numbers. *Id.* at 7-8.
7. Unsubstantiated Changes to Architectural and Area Coating Areas. *Id.* at 8-9.
8. Underestimated Operational Vehicle Trip Rates. *Id.* at 10-11.
9. Unsubstantiated Changes to Energy Use Values. *Id.* at 11.
10. Unsubstantiated Changes to Wastewater Treatment System Percentages. *Id.* at 12.
11. Incorrect Application of Construction-Related Mitigation Measures. *Id.* at 13-14.
12. Incorrect Application of Mobile-Related Operational Mitigation Measures. *Id.* at 14-15.

As a result of these errors in the DEIR, the Project's construction and operational emissions were underestimated and cannot be relied upon to determine the significance of the Project's air quality impacts.

2-5 Cont.

2. There is Substantial Evidence that the Project May Have a Significant Health Impact as a Result of Diesel Particulate Emissions.

One of the primary emissions of concern regarding health effects for land development projects is diesel particulate matter ("DPM"), which can be released during Project construction and operation. DPM consists of fine particles with a diameter less than 2.5 micrometers including a subgroup of ultrafine particles (with a diameter less than 0.1

2-6

micrometers). Diesel exhaust also contains a variety of harmful gases and cancer-causing substances. Exposure to DPM is a recognized health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. According to the California Air Resources Board ("CARB"), DPM exposure may lead to the following adverse health effects: aggravated asthma; chronic bronchitis; increased respiratory and cardiovascular hospitalizations; decreased lung function in children; lung cancer; and premature deaths for those with heart or lung disease.[1]

The DEIR concluded that the mitigated excess cancer risk posed by the Project to nearby sensitive receptors would not exceed the SCAQMD significance threshold of 10 in one million, and that the Project would result in a less-than-significant operational health risk impact. SWAPE comment, p. 15; DEIR, p. 4.2-38. SWAPE identifies four main reasons for why the DEIR's evaluation of health risk impacts and less-than-significant conclusion is incorrect.

First, the DEIR's construction HRA is incorrect due to its reliance on an exhaust PM_{10} estimate from a flawed air model. SWAPE comment, p. 16. The DEIR's HRA uses an underestimated DPM concentration, and therefore underestimates the Project's cancer risk and cannot be relied upon to determine impacts of the Project. *Id.*

Second, the DEIR did not evaluate the Project's toxic air contaminants (TACs) and associated health risk impacts. *Id.* The Traffic Impact Analysis indicates the generation of an estimated 2,517 average daily vehicle trips, but the DEIR fails to discuss potential TACs associated with Project operation or indicate the levels at which pollutants would trigger adverse health effects. *Id.* In failing to connect TAC emissions to potential health risks to nearby receptors, the Project fails to meet the CEQA requirement that projects correlate increases in project-generated emissions to adverse impacts on human health caused by those emissions. *See Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 510.

Third, the California Department of Justice recommends the preparation of a quantitative HRA pursuant to the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, as well as local air district guidelines. OEHHA released its most recent guidance document in 2015 describing which types of projects warrant preparation of an HRA. *See* "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at*: http://oehha.ca.gov/air/hot_spots/hotspots2015.html. The OEHHA document recommends that if a project is expected to last over 6 months, the exposure should be evaluated throughout the project using a 30-year exposure duration to estimate individual cancer risks. SWAPE letter, p. 16. Based on its extensive experience, SWAPE reasonably assumes that the

2-6 Cont.

[1] *See* CARB Resources - Overview: Diesel Exhaust & Health, available at https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health).

Project will last at least 30 years, and therefore recommends that health risk impacts from the project be evaluated. *Id.* A Revised EIR is therefore required to analyze these impacts.

Fourth, the FEIR fails to evaluate the "*cumulative* lifetime cancer risk to nearby, existing receptors as a result of Project *construction and operation together*." SWAPE comment, p. 17 (emphasis in original). A Revised EIR should be prepared to quantify the cumulative excess cancer risk posed by the Project's construction and operation to nearby, existing receptors, and compare it to the SCAQMD threshold of 10 in one million. *Id.*

SWAPE prepared a screening-level HRA to evaluate potential impacts from Project construction using AERSCREEN, a screening-level air quality dispersion model. SWAPE comment, p. 17. SWAPE applied a sensitive receptor distance of 125 meters and analyzed impacts to individuals at different stages of life based on OEHHA and SCAQMD guidance utilizing age sensitivity factors. *Id.* at 17-19. SWAPE found that the excess cancer risks at a sensitive receptor located approximately 125 meters away over the course of Project construction and operation is **approximately 79 in one million**. *Id.* at 19. This risk appreciably exceeds SCAQMD's threshold of 10 in one million.

SWAPE's analysis constitutes substantial evidence that the Project may have a significant health impact as a result of diesel particulate emissions. SWAPE recommends that an updated EIR be prepared which includes "a quantified air pollution model as well as an updated, quantified refined health risk assessment which adequately and accurately evaluates health risk impacts associated with both Project construction and operation." *Id.*

2-6 Cont.

3. The DEIR Failed to Adequately Analyze the Project's Greenhouse Gas Impacts and Thus the Project May Result in Significant Greenhouse Gas Emissions.

The DEIR estimates that the Project would generate net annual GHG emissions of 2,920.96 metric tons of carbon dioxide equivalent per year ("MT CO2e/year"). The DEIR also relies on the Project's consistency with the City of El Segundo Climate Action Plan, SCAG's 2020-2045 *RTP/SCS*, CALGreen, CARB's *Scoping Plan*, and the General Plan's Air Quality Element, as well as EO S-3-05 and SB 32 to conclude the Project would have less-than-significant GHG impacts. SWAPE comment, p. 20; DEIR, p. 4.6-29 – 4.6-48. However, SWAPE states that the DEIR's conclusion about a less-than-significant greenhouse gas impact is incorrect for several reasons:

1. The DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
2. The DEIR's quantitative GHG analysis relies upon an outdated threshold;
3. The DEIR's unsubstantiated air model indicates a potentially significant impact;
4. The DEIR fails to consider the performance-based standards under CARB's *Scoping Plan*; and

2-7

5. The DEIR fails to consider the performance-based standards under SCAG's *RTP/SCS*.

SWAPE comment, p. 20-27. SWAPE's analysis demonstrates potentially significant health risk and GHG impacts from the project that necessitate mitigation, and it proposes several feasible mitigation measures from CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* to reduce these impacts. *Id.* at 27. In addition to implementing these measures, the Revised EIR should include an updated air quality, health risk, and GHG analysis.

2-7 Cont.

I. CONCLUSION

For the foregoing reasons, SAFER believes that the EIR is wholly inadequate. SAFER urges the Planning Commission to refrain from recommending certification of the FEIR or recommending approval of the Project in order to allow staff additional time to address the concerns raised herein. Thank you for considering our comments and please include this letter in the record of proceedings for this project.

2-8

Sincerely,

Rebecca Davis

Indoor Air Quality Impacts

2-9

Indoor air quality (IAQ) directly impacts the comfort and health of building occupants, and the achievement of acceptable IAQ in newly constructed and renovated buildings is a well-recognized design objective. For example, IAQ is addressed by major high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014). Indoor air quality in homes is particularly important because occupants, on average, spend approximately ninety percent of their time indoors with the majority of this time spent at home (EPA, 2011). Some segments of the population that are most susceptible to the effects of poor IAQ, such as the very young and the elderly, occupy their homes almost continuously. Additionally, an increasing number of adults are working from home at least some of the time during the workweek. Indoor air quality also is a serious concern for workers in hotels, offices and other business establishments.

The concentrations of many air pollutants often are elevated in homes and other buildings relative to outdoor air because many of the materials and products used indoors contain and release a variety of pollutants to air (Hodgson et al., 2002; Offermann and Hodgson,

2011). With respect to indoor air contaminants for which inhalation is the primary route of exposure, the critical design and construction parameters are the provision of adequate ventilation and the reduction of indoor sources of the contaminants.

Indoor Formaldehyde Concentrations Impact. In the California New Home Study (CNHS) of 108 new homes in California (Offermann, 2009), 25 air contaminants were measured, and formaldehyde was identified as the indoor air contaminant with the highest cancer risk as determined by the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), No Significant Risk Levels (NSRL) for carcinogens. The NSRL is the daily intake level calculated to result in one excess case of cancer in an exposed population of 100,000 (i.e., ten in one million cancer risk) and for formaldehyde is 40 µg/day. The NSRL concentration of formaldehyde that represents a daily dose of 40 µg is 2 µg/m^3, assuming a continuous 24-hour exposure, a total daily inhaled air volume of 20 m^3, and 100% absorption by the respiratory system. All of the CNHS homes exceeded this NSRL concentration of 2 µg/m^3. The median indoor formaldehyde concentration was 36 µg/m^3, and ranged from 4.8 to 136 µg/m^3, which corresponds to a median exceedance of the 2 µg/m^3 NSRL concentration of 18 and a range of 2.3 to 68.

2-9 Cont.

Therefore, the cancer risk of a resident living in a California home with the median indoor formaldehyde concentration of 36 µg/m^3, is 180 per million as a result of formaldehyde alone. The CEQA significance threshold for airborne cancer risk is 10 per million, as established by the South Coast Air Quality Management District (SCAQMD, 2015).

Besides being a human carcinogen, formaldehyde is also a potent eye and respiratory irritant. In the CNHS, many homes exceeded the non-cancer reference exposure levels (RELs) prescribed by California Office of Environmental Health Hazard Assessment (OEHHA, 2017b). The percentage of homes exceeding the RELs ranged from 98% for the Chronic REL of 9 µg/m^3 to 28% for the Acute REL of 55 µg/m^3.

The primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and

particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims.

In January 2009, the California Air Resources Board (CARB) adopted an airborne toxics control measure (ATCM) to reduce formaldehyde emissions from composite wood products, including hardwood plywood, particleboard, medium density fiberboard, and also furniture and other finished products made with these wood products (California Air Resources Board 2009). While this formaldehyde ATCM has resulted in reduced emissions from composite wood products sold in California, they do not preclude that homes built with composite wood products meeting the CARB ATCM will have indoor formaldehyde concentrations below cancer and non-cancer exposure guidelines.

A follow up study to the California New Home Study (CNHS) was conducted in 2016-2018 (Singer et. al., 2019), and found that the median indoor formaldehyde in new homes built after 2009 with CARB Phase 2 Formaldehyde ATCM materials had lower indoor formaldehyde concentrations, with a median indoor concentrations of 22.4 $\mu g/m^3$ (18.2 ppb) as compared to a median of 36 $\mu g/m^3$ found in the 2007 CNHS. Unlike in the CNHS study where formaldehyde concentrations were measured with pumped DNPH samplers, the formaldehyde concentrations in the HENGH study were measured with passive samplers, which were estimated to under-measure the true indoor formaldehyde concentrations by approximately 7.5%. Applying this correction to the HENGH indoor formaldehyde concentrations results in a median indoor concentration of 24.1 $\mu g/m^3$, which is 33% lower than the 36 $\mu g/m^3$ found in the 2007 CNHS.

Thus, while new homes built after the 2009 CARB formaldehyde ATCM have a 33% lower median indoor formaldehyde concentration and cancer risk, the median lifetime cancer risk is still 120 per million for homes built with CARB compliant composite wood products. This median lifetime cancer risk is more than 12 times the OEHHA 10 in a million cancer risk threshold (OEHHA, 2017a).

With respect to the Pacific Coast Commons Project, El Segundo, CA the buildings consist of residential and commercial spaces.

2-9 Cont.

The residential occupants will potentially have continuous exposure (e.g. 24 hours per day, 52 weeks per year). These exposures are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in residential construction.

Because these residences will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor residential formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu g/m^3$ (Singer et. al., 2020)

Assuming that the residential occupants inhale 20 m^3 of air per day, the average 70-year lifetime formaldehyde daily dose is 482 µg/day for continuous exposure in the residences. This exposure represents a cancer risk of 120 per million, which is more than 12 times the CEQA cancer risk of 10 per million. For occupants that do not have continuous exposure, the cancer risk will be proportionally less but still substantially over the CEQA cancer risk of 10 per million (e.g. for 12/hour/day occupancy, more than 6 times the CEQA cancer risk of 10 per million).

The employees of the commercial spaces are expected to experience significant indoor exposures (e.g., 40 hours per week, 50 weeks per year). These exposures for employees are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in offices, warehouses, residences and hotels.

Because the commercial spaces will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 24.1 $\mu g/m^3$ (Singer et. al., 2020)

2-9 Cont.

Assuming that the employees of commercial spaces work 8 hours per day and inhale 20 m^3 of air per day, the formaldehyde dose per work-day at the offices is 161 µg/day.

Assuming that these employees work 5 days per week and 50 weeks per year for 45 years (start at age 20 and retire at age 65) the average 70-year lifetime formaldehyde daily dose is 70.9 µg/day.

This is 1.77 times the NSRL (OEHHA, 2017a) of 40 µg/day and represents a cancer risk of 17.7 per million, which exceeds the CEQA cancer risk of 10 per million. This impact should be analyzed in an environmental impact report ("EIR"), and the agency should impose all feasible mitigation measures to reduce this impact. Several feasible mitigation measures are discussed below and these and other measures should be analyzed in an EIR.

Appendix A, Indoor Formaldehyde Concentrations and the CARB Formaldehyde ATCM, provides analyses that show utilization of CARB Phase 2 Formaldehyde ATCM materials will not ensure acceptable cancer risks with respect to formaldehyde emissions from composite wood products.

Even composite wood products manufactured with CARB certified ultra low emitting formaldehyde (ULEF) resins do not insure that the indoor air will have concentrations of formaldehyde the meet the OEHHA cancer risks that substantially exceed 10 per million. The permissible emission rates for ULEF composite wood products are only 11-15% lower than the CARB Phase 2 emission rates. Only use of composite wood products made with no-added formaldehyde resins (NAF), such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

The following describes a method that should be used, prior to construction in the environmental review under CEQA, for determining whether the indoor concentrations resulting from the formaldehyde emissions of specific building materials/furnishings selected exceed cancer and non-cancer guidelines. Such a design analyses can be used to identify those materials/furnishings prior to the completion of the City's CEQA review and project approval, that have formaldehyde emission rates that contribute to indoor

2-9 Cont.

concentrations that exceed cancer and non-cancer guidelines, so that alternative lower emitting materials/furnishings may be selected and/or higher minimum outdoor air ventilation rates can be increased to achieve acceptable indoor concentrations and incorporated as mitigation measures for this project.

Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment

This formaldehyde emissions assessment should be used in the environmental review under CEQA to assess the indoor formaldehyde concentrations from the proposed loading of building materials/furnishings, the area-specific formaldehyde emission rate data for building materials/furnishings, and the design minimum outdoor air ventilation rates. This assessment allows the applicant (and the City) to determine, before the conclusion of the environmental review process and the building materials/furnishings are specified, purchased, and installed, if the total chemical emissions will exceed cancer and non-cancer guidelines, and if so, allow for changes in the selection of specific material/furnishings and/or the design minimum outdoor air ventilations rates such that cancer and non-cancer guidelines are not exceeded.

1.) Define Indoor Air Quality Zones. Divide the building into separate indoor air quality zones, (IAQ Zones). IAQ Zones are defined as areas of well-mixed air. Thus, each ventilation system with recirculating air is considered a single zone, and each room or group of rooms where air is not recirculated (e.g. 100% outdoor air) is considered a separate zone. For IAQ Zones with the same construction material/furnishings and design minimum outdoor air ventilation rates. (e.g. hotel rooms, apartments, condominiums, etc.) the formaldehyde emission rates need only be assessed for a single IAQ Zone of that type.

2.) Calculate Material/Furnishing Loading. For each IAQ Zone, determine the building material and furnishing loadings (e.g., m^2 of material/m^2 floor area, units of furnishings/m^2 floor area) from an inventory of all potential indoor formaldehyde sources, including flooring, ceiling tiles, furnishings, finishes, insulation, sealants, adhesives, and any products constructed with composite wood products containing urea-formaldehyde resins (e.g., plywood, medium density fiberboard, particleboard).

2-9 Cont.

3.) Calculate the Formaldehyde Emission Rate. For each building material, calculate the formaldehyde emission rate (µg/h) from the product of the area-specific formaldehyde emission rate (µg/m²-h) and the area (m²) of material in the IAQ Zone, and from each furnishing (e.g. chairs, desks, etc.) from the unit-specific formaldehyde emission rate (µg/unit-h) and the number of units in the IAQ Zone.

NOTE: As a result of the high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014), most manufacturers of building materials furnishings sold in the United States conduct chemical emission rate tests using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers," (CDPH, 2017), or other equivalent chemical emission rate testing methods. Most manufacturers of building furnishings sold in the United States conduct chemical emission rate tests using ANSI/BIFMA M7.1 Standard Test Method for Determining VOC Emissions (BIFMA, 2018), or other equivalent chemical emission rate testing methods.

CDPH, BIFMA, and other chemical emission rate testing programs, typically certify that a material or furnishing does not create indoor chemical concentrations in excess of the maximum concentrations permitted by their certification. For instance, the CDPH emission rate testing requires that the measured emission rates when input into an office, school, or residential model do not exceed one-half of the OEHHA Chronic Exposure Guidelines (OEHHA, 2017b) for the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017). These certifications themselves do not provide the actual area-specific formaldehyde emission rate (i.e., µg/m²-h) of the product, but rather provide data that the formaldehyde emission rates do not exceed the maximum rate allowed for the certification. Thus, for example, the data for a certification of a specific type of flooring may be used to calculate that the area-specific emission rate of formaldehyde is less than 31 µg/m²-h, but not the actual measured specific emission rate, which may be 3, 18, or 30 µg/m²-h. These area-specific emission rates determined from the product certifications of CDPH, BIFA, and other certification programs can be used as an initial estimate of the formaldehyde emission rate.

2-9 Cont.

If the actual area-specific emission rates of a building material or furnishing is needed (i.e. the initial emission rates estimates from the product certifications are higher than desired), then that data can be acquired by requesting from the manufacturer the complete chemical emission rate test report. For instance if the complete CDPH emission test report is requested for a CDHP certified product, that report will provide the actual area-specific emission rates for not only the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017), but also all of the cancer and reproductive/developmental chemicals listed in the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), all of the toxic air contaminants (TACs) in the California Air Resources Board Toxic Air Contamination List (CARB, 2011), and the 10 chemicals with the greatest emission rates.

Alternatively, a sample of the building material or furnishing can be submitted to a chemical emission rate testing laboratory, such as Berkeley Analytical Laboratory (https://berkeleyanalytical.com), to measure the formaldehyde emission rate.

4.) Calculate the Total Formaldehyde Emission Rate. For each IAQ Zone, calculate the total formaldehyde emission rate (i.e. µg/h) from the individual formaldehyde emission rates from each of the building material/furnishings as determined in Step 3.

5.) Calculate the Indoor Formaldehyde Concentration. For each IAQ Zone, calculate the indoor formaldehyde concentration (µg/m³) from Equation 1 by dividing the total formaldehyde emission rates (i.e. µg/h) as determined in Step 4, by the design minimum outdoor air ventilation rate (m³/h) for the IAQ Zone.

$$C_{in} = \frac{E_{total}}{Q_{oa}} \quad \text{(Equation 1)}$$

where:

C_{in} = indoor formaldehyde concentration (µg/m³)

E_{total} = total formaldehyde emission rate (µg/h) into the IAQ Zone.

Q_{oa} = design minimum outdoor air ventilation rate to the IAQ Zone (m³/h)

The above Equation 1 is based upon mass balance theory, and is referenced in Section

2-9 Cont.

3.10.2 "Calculation of Estimated Building Concentrations" of the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers", (CDPH, 2017).

6.) Calculate the Indoor Exposure Cancer and Non-Cancer Health Risks. For each IAQ Zone, calculate the cancer and non-cancer health risks from the indoor formaldehyde concentrations determined in Step 5 and as described in the OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines; Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015).

7.) Mitigate Indoor Formaldehyde Exposures of exceeding the CEQA Cancer and/or Non-Cancer Health Risks. In each IAQ Zone, provide mitigation for any formaldehyde exposure risk as determined in Step 6, that exceeds the CEQA cancer risk of 10 per million or the CEQA non-cancer Hazard Quotient of 1.0.

Provide the source and/or ventilation mitigation required in all IAQ Zones to reduce the health risks of the chemical exposures below the CEQA cancer and non-cancer health risks.

Source mitigation for formaldehyde may include:

1.) reducing the amount materials and/or furnishings that emit formaldehyde
2.) substituting a different material with a lower area-specific emission rate of formaldehyde

Ventilation mitigation for formaldehyde emitted from building materials and/or furnishings may include:

1.) increasing the design minimum outdoor air ventilation rate to the IAQ Zone.

NOTE: Mitigating the formaldehyde emissions through use of less material/furnishings, or use of lower emitting materials/furnishings, is the preferred mitigation option, as mitigation with increased outdoor air ventilation increases initial and operating costs associated with the heating/cooling systems.

9 of 19

2-9 Cont.

Further, we are not asking that the builder "speculate" on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers," (CDPH, 2017), and use the procedure described earlier above (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Impact. Another important finding of the CNHS, was that the outdoor air ventilation rates in the homes were very low. Outdoor air ventilation is a very important factor influencing the indoor concentrations of air contaminants, as it is the primary removal mechanism of all indoor air generated contaminants. Lower outdoor air exchange rates cause indoor generated air contaminants to accumulate to higher indoor air concentrations. Many homeowners rarely open their windows or doors for ventilation as a result of their concerns for security/safety, noise, dust, and odor concerns (Price, 2007). In the CNHS field study, 32% of the homes did not use their windows during the 24-hour Test Day, and 15% of the homes did not use their windows during the entire preceding week. Most of the homes with no window usage were homes in the winter field session. Thus, a substantial percentage of homeowners never open their windows, especially in the winter season. The median 24-hour measurement was 0.26 air changes per hour (ach), with a range of 0.09 ach to 5.3 ach. A total of 67% of the homes had outdoor air exchange rates below the minimum California Building Code (2001) requirement of 0.35 ach. Thus, the relatively tight envelope construction, combined with the fact that many people never open their windows for ventilation, results in homes with low outdoor air exchange rates and higher indoor air contaminant concentrations.

The Pacific Coast Commons Project is close to roads with moderate to high traffic (e.g., Pacific Coast Highway, E. Mariposa Avenue, E. Holly Avenue, Indiana Street, etc.) as well as air traffic from Los Angeles International Airport, and thus the Project site is a sound impacted site.

10 of 19

2-9 Cont.

According to the Pacific Coast Commons Specific Plan - Draft Environmental Impact Report (Dudek, 2021), The future plus project traffic noise levels reported in Table 4.10-6 range from 55.4 dBA to 70.2 dBA CNEL.

As a result of the anticipated high outdoor noise levels, the current project will require a mechanical supply of outdoor air ventilation to allow for a habitable interior environment with closed windows and doors. Such a ventilation system would allow windows and doors to be kept closed at the occupant's discretion to control exterior noise within building interiors.

$PM_{2.5}$ Outdoor Concentrations Impact. An additional impact of the nearby motor vehicle traffic associated with this project, are the outdoor concentrations of $PM_{2.5}$. According to the Pacific Coast Commons Specific Plan - Draft Environmental Impact Report (Dudek, 2021), the Project is located in the South Coast Air Basin, which is a State and Federal non-attainment area for $PM_{2.5}$.

An air quality analyses should to be conducted to determine the concentrations of $PM_{2.5}$ in the outdoor and indoor air that people inhale each day. This air quality analyses needs to consider the cumulative impacts of the project related emissions, existing and projected future emissions from local $PM_{2.5}$ sources (e.g. stationary sources, motor vehicles, and airport traffic) upon the outdoor air concentrations at the Project site. If the outdoor concentrations are determined to exceed the California and National annual average $PM_{2.5}$ exceedence concentration of 12 $\mu g/m^3$, or the National 24-hour average exceedence concentration of 35 $\mu g/m^3$, then the buildings need to have a mechanical supply of outdoor air that has air filtration with sufficient removal efficiency, such that the indoor concentrations of outdoor $PM_{2.5}$ particles is less than the California and National $PM_{2.5}$ annual and 24-hour standards.

It is my experience that based on the projected high traffic noise levels, the annual average concentration of $PM_{2.5}$ will exceed the California and National $PM_{2.5}$ annual and 24-hour

2-9 Cont.

standards and warrant installation of high efficiency air filters (i.e. MERV 13 or higher) in all mechanically supplied outdoor air ventilation systems.

Indoor Air Quality Impact Mitigation Measures

The following are recommended mitigation measures to minimize the impacts upon indoor quality:

Indoor Formaldehyde Concentrations Mitigation. Use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins (CARB, 2009). CARB Phase 2 certified composite wood products, or ultra-low emitting formaldehyde (ULEF) resins, do not insure indoor formaldehyde concentrations that are below the CEQA cancer risk of 10 per million. Only composite wood products manufactured with CARB approved no-added formaldehyde (NAF) resins, such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

Alternatively, conduct the previously described Pre-Construction Building Material/Furnishing Chemical Emissions Assessment, to determine that the combination of formaldehyde emissions from building materials and furnishings do not create indoor formaldehyde concentrations that exceed the CEQA cancer and non-cancer health risks.

It is important to note that we are not asking that the builder "speculate" on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers", (CDPH, 2017), and use the procedure described above (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

2-9 Cont.

Outdoor Air Ventilation Mitigation. Provide each habitable room with a continuous mechanical supply of outdoor air that meets or exceeds the California 2016 Building Energy Efficiency Standards (California Energy Commission, 2015) requirements of the greater of 15 cfm/occupant or 0.15 cfm/ft^2 of floor area. Following installation of the system conduct testing and balancing to insure that required amount of outdoor air is entering each habitable room and provide a written report documenting the outdoor airflow rates. Do not use exhaust only mechanical outdoor air systems, use only balanced outdoor air supply and exhaust systems or outdoor air supply only systems. Provide a manual for the occupants or maintenance personnel, that describes the purpose of the mechanical outdoor air system and the operation and maintenance requirements of the system.

$PM_{2.5}$ Outdoor Air Concentration Mitigation. Install air filtration with sufficient $PM_{2.5}$ removal efficiency (e.g. MERV 13 or higher) to filter the outdoor air entering the mechanical outdoor air supply systems, such that the indoor concentrations of outdoor $PM_{2.5}$ particles are less than the California and National $PM_{2.5}$ annual and 24-hour standards. Install the air filters in the system such that they are accessible for replacement by the occupants or maintenance personnel. Include in the mechanical outdoor air ventilation system manual instructions on how to replace the air filters and the estimated frequency of replacement.

APPENDIX A

INDOOR FORMALDEHYDE CONCENTRATIONS
AND THE
CARB FORMALDEHYDE ATCM

With respect to formaldehyde emissions from composite wood products, the CARB ATCM regulations of formaldehyde emissions from composite wood products, do not assure healthful indoor air quality. The following is the stated purpose of the CARB ATCM regulation - *The purpose of this airborne toxic control measure is to "reduce formaldehyde emissions from composite wood products, and finished goods that contain composite wood products, that are sold, offered for sale, supplied, used, or manufactured for sale in California"*. In other words, the CARB ATCM regulations do not "assure healthful indoor air quality", but rather "reduce formaldehyde emissions from composite wood products".

Just how much protection do the CARB ATCM regulations provide building occupants from the formaldehyde emissions generated by composite wood products? Definitely some, but certainly the regulations do not "*assure healthful indoor air quality*" when CARB Phase 2 products are utilized. As shown in the Chan 2019 study of new California homes, the median indoor formaldehyde concentration was of 22.4 $\mu g/m^3$ (18.2 ppb), which corresponds to a cancer risk of 112 per million for occupants with continuous exposure, which is more than 11 times the CEQA cancer risk of 10 per million.

Another way of looking at how much protection the CARB ATCM regulations provide building occupants from the formaldehyde emissions generated by composite wood products is to calculate the maximum number of square feet of composite wood product that can be in a residence without exceeding the CEQA cancer risk of 10 per million for occupants with continuous occupancy.

For this calculation I utilized the floor area (2,272 ft^2), the ceiling height (8.5 ft), and the number of bedrooms (4) as defined in Appendix B (New Single-Family Residence Scenario) of the Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers, Version 1.1, 2017, California Department of Public Health,

17 of 19

2-9
Cont.

Richmond, CA. https://www.cdph.ca.gov/Programs/CCDPHP/DEODC/EHLB/IAQ/Pages/VOC.aspx.

For the outdoor air ventilation rate I used the 2019 Title 24 code required mechanical ventilation rate (ASHRAE 62.2) of 106 cfm (180 m^3/h) calculated for this model residence. For the composite wood formaldehyde emission rates I used the CARB ATCM Phase 2 rates.

The calculated maximum number of square feet of composite wood product that can be in a residence, without exceeding the CEQA cancer risk of 10 per million for occupants with continuous occupancy are as follows for the different types of regulated composite wood products.

Medium Density Fiberboard (MDF) – 15 ft^2 (0.7% of the floor area), or
Particle Board – 30 ft^2 (1.3% of the floor area), or
Hardwood Plywood – 54 ft^2 (2.4% of the floor area), or
Thin MDF – 46 ft^2 (2.0 % of the floor area).

For offices and hotels the calculated maximum amount of composite wood product (% of floor area) that can be used without exceeding the CEQA cancer risk of 10 per million for occupants, assuming 8 hours/day occupancy, and the California Mechanical Code minimum outdoor air ventilation rates are as follows for the different types of regulated composite wood products.

Medium Density Fiberboard (MDF) – 3.6 % (offices) and 4.6% (hotel rooms), or
Particle Board – 7.2 % (offices) and 9.4% (hotel rooms), or
Hardwood Plywood – 13 % (offices) and 17% (hotel rooms), or
Thin MDF – 11 % (offices) and 14 % (hotel rooms)

Clearly the CARB ATCM does not regulate the formaldehyde emissions from composite wood products such that the potentially large areas of these products, such as for flooring, baseboards, interior doors, window and door trims, and kitchen and bathroom cabinetry, could be used without causing indoor formaldehyde concentrations that result in CEQA

2-9 Cont.

cancer risks that substantially exceed 10 per million for occupants with continuous occupancy.

Even composite wood products manufactured with CARB certified ultra low emitting formaldehyde (ULEF) resins do not insure that the indoor air will have concentrations of formaldehyde the meet the OEHHA cancer risks that substantially exceed 10 per million. The permissible emission rates for ULEF composite wood products are only 11-15% lower than the CARB Phase 2 emission rates. Only use of composite wood products made with no-added formaldehyde resins (NAF), such as resins made from soy, polyvinyl acetate, or methylene diisocyanate can insure that the OEHHA cancer risk of 10 per million is met.

If CARB Phase 2 compliant or ULEF composite wood products are utilized in construction, then the resulting indoor formaldehyde concentrations should be determined in the design phase using the specific amounts of each type of composite wood product, the specific formaldehyde emission rates, and the volume and outdoor air ventilation rates of the indoor spaces, and all feasible mitigation measures employed to reduce this impact (e.g. use less formaldehyde containing composite wood products and/or incorporate mechanical systems capable of higher outdoor air ventilation rates). See the procedure described earlier (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Alternatively, and perhaps a simpler approach, is to use only composite wood products (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins.

Education

M.S. Mechanical Engineering (1985)
Stanford University, Stanford, CA.

Graduate Studies in Air Pollution Monitoring and Control (1980)
University of California, Berkeley, CA.

B.S. in Mechanical Engineering (1976)
Rensselaer Polytechnic Institute, Troy, N.Y.

Professional Experience

President: Indoor Environmental Engineering, San Francisco, CA. December, 1981 - present.

Direct team of environmental scientists, chemists, and mechanical engineers in conducting State and Federal research regarding indoor air quality instrumentation development, building air quality field studies, ventilation and air cleaning performance measurements, and chemical emission rate testing.

Provide design side input to architects regarding selection of building materials and ventilation system components to ensure a high quality indoor environment.

Direct Indoor Air Quality Consulting Team for the winning design proposal for the new State of Washington Ecology Department building.

Develop a full-scale ventilation test facility for measuring the performance of air diffusers: ASHRAE 129, Air Change Effectiveness, and ASHRAE 113, Air Diffusion Performance Index.

Develop a chemical emission rate testing laboratory for measuring the chemical emissions from building materials, furnishings, and equipment.

Principle Investigator of the California New Homes Study (2005-2007). Measured ventilation and indoor air quality in 108 new single family detached homes in northern and southern California.

Develop and teach IAQ professional development workshops to building owners, managers, hygienists, and engineers.

2-10

Air Pollution Engineer: Earth Metrics Inc., Burlingame, CA, October, 1985 to March, 1987.

Responsible for development of an air pollution laboratory including installation a forced choice olfactometer, tracer gas electron capture chromatograph, and associated calibration facilities. Field team leader for studies of fugitive odor emissions from sewage treatment plants, entrainment of fume hood exhausts into computer chip fabrication rooms, and indoor air quality investigations.

Staff Scientist: Building Ventilation and Indoor Air Quality Program, Energy and Environment Division, Lawrence Berkeley Laboratory, Berkeley, CA. January, 1980 to August, 1984.

Deputy project leader for the Control Techniques group; responsible for laboratory and field studies aimed at evaluating the performance of indoor air pollutant control strategies (i.e. ventilation, filtration, precipitation, absorption, adsorption, and source control).

Coordinated field and laboratory studies of air-to-air heat exchangers including evaluation of thermal performance, ventilation efficiency, cross-stream contaminant transfer, and the effects of freezing/defrosting.

Developed an *in situ* test protocol for evaluating the performance of air cleaning systems and introduced the concept of effective cleaning rate (ECR) also known as the Clean Air Delivery Rate (CADR).

Coordinated laboratory studies of portable and ducted air cleaning systems and their effect on indoor concentrations of respirable particles and radon progeny.

Co-designed an automated instrument system for measuring residential ventilation rates and radon concentrations.

Designed hardware and software for a multi-channel automated data acquisition system used to evaluate the performance of air-to-air heat transfer equipment.

Assistant Chief Engineer: Alta Bates Hospital, Berkeley, CA, October, 1979 to January, 1980.

Responsible for energy management projects involving installation of power factor correction capacitors on large inductive electrical devices and installation of steam meters on physical plant steam lines. Member of Local 39, International Union of Operating Engineers.

Manufacturing Engineer: American Precision Industries, Buffalo, NY, October, 1977 to October, 1979.

2

2-10 Cont.

Responsible for reorganizing the manufacturing procedures regarding production of shell and tube heat exchangers. Designed customized automatic assembly, welding, and testing equipment. Designed a large paint spray booth. Prepared economic studies justifying new equipment purchases. Safety Director.

Project Engineer: Arcata Graphics, Buffalo, N.Y. June, 1976 to October, 1977.

Responsible for the design and installation of a bulk ink storage and distribution system and high speed automatic counting and marking equipment. Also coordinated material handling studies which led to the purchase and installation of new equipment.

PROFESSIONAL ORGANIZATION MEMBERSHIP

American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

- Chairman of SPC-145P, Standards Project Committee - Test Method for Assessing the Performance of Gas Phase Air Cleaning Equipment (1991-1992)
- Member SPC-129P, Standards Project Committee - Test Method for Ventilation Effectiveness (1986-97)
  - Member of Drafting Committee
- Member Environmental Health Committee (1992-1994, 1997-2001, 2007-2010)
  - Chairman of EHC Research Subcommittee
  - Member of Man Made Mineral Fiber Position Paper Subcommittee
  - Member of the IAQ Position Paper Committee
  - Member of the Legionella Position Paper Committee
  - Member of the Limiting Indoor Mold and Dampness in Buildings Position Paper Committee
- Member SSPC-62, Standing Standards Project Committee - Ventilation for Acceptable Indoor Air Quality (1992 to 2000)
  - Chairman of Source Control and Air Cleaning Subcommittee
- Chairman of TC-4.10, Indoor Environmental Modeling (1988-92)
  - Member of Research Subcommittee
- Chairman of TC-2.3, Gaseous Air Contaminants and Control Equipment (1989-92)
  - Member of Research Subcommittee

Chair, Electronic Cigarettes: Chemical Emissions and Exposures Colloquium, Indoor Air 2016, Ghent, Belgium, July 4, 2016.

SPECIAL CONSULTATION

Provide consultation to the American Home Appliance Manufacturers on the development of a standard for testing portable air cleaners, AHAM Standard AC-1.

Served as an expert witness and special consultant for the U.S. Federal Trade Commission regarding the performance claims found in advertisements of portable air cleaners and residential furnace filters.

Conducted a forensic investigation for a San Mateo, CA pro se defendant, regarding an alleged homicide where the victim was kidnapped in a steamer trunk. Determined the air exchange rate in the steamer trunk and how long the person could survive.

Conducted *in situ* measurement of human exposure to toluene fumes released during nailpolish application for a plaintiffs attorney pursuing a California Proposition 65 product labeling case. June, 1993.

Conducted a forensic *in situ* investigation for the Butte County, CA Sheriff's Department of the emissions of a portable heater used in the bedroom of two twin one year old girls who suffered simultaneous crib death.

Consult with OSHA on the 1995 proposed new regulation regarding indoor air quality and environmental tobacco smoke.

5

2-10 Cont.

Consult with EPA on the proposed Building Alliance program and with OSHA on the proposed new OSHA IAQ regulation.

Johnson Controls Audit/Certification Expert Review; Milwaukee, WI. May 28-29, 1997.

Winner of the nationally published 1999 Request for Proposals by the State of Washington to conduct a comprehensive indoor air quality investigation of the Washington State Department of Ecology building in Lacey, WA.

Selected by the State of California Attorney General's Office in August, 2000 to conduct a comprehensive indoor air quality investigation of the Tulare County Court House.

Lawrence Berkeley Laboratory IAQ Experts Workshop: "Cause and Prevention of Sick Building Problems in Offices: The Experience of Indoor Environmental Quality Investigators", Berkeley, California, May 26-27, 2004.

Provide consultation and chemical emission rate testing to the State of California Attorney General's Office in 2013-2015 regarding the chemical emissions from e-cigarettes.

RE: Pacific Coast Commons Specific Plan Project

Dear Mr. Samaras,

On behalf of the Southwest Regional Council of Carpenters ("**Commenter**" or "**Carpenter**"), my Office is submitting these comments on the City of El Segundo's ("**City**" or "**Lead Agency**") Draft Environmental Impact Report ("**DEIR**") (SCH No. 2020050508) for the Pacific Coast Commons Specific Plan Project which would demolish existing structures, including a former restaurant with meeting/ballroom space, a rental car tenant, and the existing surface parking lots of the Fairfield Inn & Suites by Marriott and Aloft Hotel properties, and would allow for the development of up to 263 new housing units and approximately 11,250 gross square feet of new commercial/retail uses, and associated parking. ("**Project**").

The Southwest Carpenters is a labor union representing 50,000 union carpenters in six states and has a strong interest in well ordered land use planning and addressing the environmental impacts of development projects.

Individual members of the Southwest Carpenters live, work and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Commenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal. App. 4th 1184, 1199-1203; see *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121.

2-11

Commenters expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearings and proceedings related to this Project. Cal. Gov. Code § 65009(b); Cal. Pub. Res. Code § 21177(a); *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal. App. 4th 1184, 1199-1203; see *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121.

Commenters incorporates by reference all comments raising issues regarding the EIR submitted prior to certification of the EIR for the Project. *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal. App. 4th 173, 191 (finding that any party who has objected to the Project's environmental documentation may assert any issue timely raised by other parties).

Moreover, Commenter requests that the Lead Agency provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act ("**CEQA**"), Cal Public Resources Code ("**PRC**") § 21000 *et seq*, and the California Planning and Zoning Law ("**Planning and Zoning Law**"), Cal. Gov't Code §§ 65000–65010. California Public Resources Code Sections 21092.2, and 21167(f) and Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

2-11 Cont.

The City should require the Applicant provide additional community benefits such as requiring local hire and use of a skilled and trained workforce to build the Project. The City should require the use of workers who have graduated from a Joint Labor Management apprenticeship training program approved by the State of California, or have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a state approved apprenticeship training program or who are registered apprentices in an apprenticeship training program approved by the State of California.

Community benefits such as local hire and skilled and trained workforce requirements can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project Site can reduce the length of vendor trips, reduce greenhouse gas emissions and providing localized economic benefits. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project Site can reduce the length of vendor trips,

reduce greenhouse gas emissions and providing localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Skilled and trained workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the UC Berkeley Center for Labor Research and Education concluded:

> . . . labor should be considered an investment rather than a cost – and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

2-11 Cont.

The City should also require the Project to be built to standards exceeding the current 2019 California Green Building Code to mitigate the Project's environmental impacts and to advance progress towards the State of California's environmental goals.

I. EXPERTS

This comment letter includes comments from air quality and greenhouse gas experts Matt Hagemann, P.G., C.Hg. and Paul Rosenfeld, Ph.D. concerning the DEIR. Their comments, attachments, and Curriculum Vitae ("CV") are attached hereto and are incorporated herein by reference.

Matt Hagemann, P.G., C.Hg. ("Mr. Hagemann") has over 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf

and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Mr. Hagemann also served as Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closer. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring.

For the past 15 years, Mr. Hagemann has worked as a founding partner with SWAPE (Soil/Water/Air Protection Enterprise). At SWAPE, Mr. Hagemann has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality, and greenhouse gas emissions.

Mr. Hagemann has a Bachelor of Arts degree in geology from Humboldt State University in California and a Masters in Science degree from California State University Los Angeles in California.

Paul Rosenfeld, Ph.D. ("Dr. Rosenfeld") is a principal environmental chemist at SWAPE. Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts on human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risks, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particular matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants, Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert

2-11 Cont.

on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Dr. Rosenfeld has a Ph.D. in soil chemistry from the University of Washington, M.S. in environmental science from U.C. Berkeley, and B.A. in environmental studies from U.C. Santa Barbara.

II. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

CEQA has two basic purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 California Code of Regulations ("**CCR**" or "**CEQA Guidelines**") § 15002(a)(1).[2] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made. Thus, the EIR 'protects not only the environment but also informed self-government.' [Citation.]" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564. The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs.* (2001) 91 Cal. App. 4th 1344, 1354 ("*Berkeley Jets*"); *County of Inyo v. Yorty* (1973) 32 Cal. App. 3d 795, 810.

Second, CEQA directs public agencies to avoid or reduce environmental damage when possible by requiring alternatives or mitigation measures. CEQA Guidelines § 15002(a)(2) and (3). *See also, Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta*

2-11 Cont.

[2] The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 *et seq*, are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. (Cal. Pub. Res. Code § 21083.) The CEQA Guidelines are given "great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous." *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal. 4th 204, 217.

Valley v. Board of Supervisors (1990) 52 Cal.3d 553; *Laurel Heights Improvement Ass'n v. Regents of the University of California* (1988) 47 Cal. 3d 376, 400. The EIR serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in CEQA section 21081. CEQA Guidelines § 15092(b)(2)(A–B).

While the courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position.' A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" *Berkeley Jets*, 91 Cal.App.4th 1344, 1355 (emphasis added) (quoting *Laurel Heights*, 47 Cal.3d at 391, 409 fn. 12). Drawing this line and determining whether the EIR complies with CEQA's information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. Cnty. of Fresno* (2018) 6 Cal. 5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal. App. 4th 48, 102, 131. As the court stated in *Berkeley Jets*, 91 Cal. App. 4th at 1355:

> A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process.

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Communities for a Better Environment v. Richmond* (2010) 184 Cal. App. 4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449–450).

2-11 Cont.

B. CEQA Requires Revision and Recirculation of an Environmental Impact Report When Substantial Changes or New Information Comes to Light

Section 21092.1 of the California Public Resources Code requires that "[w]hen significant new information is added to an environmental impact report after notice has been given pursuant to Section 21092 … but prior to certification, the public agency shall give notice again pursuant to Section 21092, and consult again pursuant to Sections 21104 and 21153 before certifying the environmental impact report" in order to give the public a chance to review and comment upon the information. CEQA Guidelines § 15088.5.

Significant new information includes "changes in the project or environmental setting as well as additional data or other information" that "deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative)." CEQA Guidelines § 15088.5(a). Examples of significant new information requiring recirculation include "new significant environmental impacts from the project or from a new mitigation measure," "substantial increase in the severity of an environmental impact," "feasible project alternative or mitigation measure considerably different from others previously analyzed" as well as when "the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." *Id.*

An agency has an obligation to recirculate an environmental impact report for public notice and comment due to "significant new information" regardless of whether the agency opts to include it in a project's environmental impact report. *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 74, 95 [finding that in light of a new expert report disclosing potentially significant impacts to groundwater supply "the EIR should have been revised and recirculated for purposes of informing the public and governmental agencies of the volume of groundwater at risk and to allow the public and governmental agencies to respond to such information."]. If significant new information was brought to the attention of an agency prior to certification, an agency is required to revise and recirculate that information as part of the environmental impact report.

2-11 Cont.

C. Due to the COVID-19 Crisis, the City Must Adopt a Mandatory Finding of Significance that the Project May Cause a Substantial Adverse Effect on Human Beings and Mitigate COVID-19 Impacts

CEQA requires that an agency make a finding of significance when a Project may cause a significant adverse effect on human beings. PRC § 21083(b)(3); CEQA Guidelines § 15065(a)(4).

Public health risks related to construction work requires a mandatory finding of significance under CEQA. Construction work has been defined as a Lower to High-risk activity for COVID-19 spread by the Occupations Safety and Health Administration. Recently, several construction sites have been identified as sources of community spread of COVID-19.[3]

SWRCC recommends that the Lead Agency adopt additional CEQA mitigation measures to mitigate public health risks from the Project's construction activities. SWRCC requests that the Lead Agency require safe on-site construction work practices as well as training and certification for any construction workers on the Project Site.

In particular, based upon SWRCC's experience with safe construction site work practices, SWRCC recommends that the Lead Agency require that while construction activities are being conducted at the Project Site:

Construction Site Design:

- The Project Site will be limited to two controlled entry points.
- Entry points will have temperature screening technicians taking temperature readings when the entry point is open.
- The Temperature Screening Site Plan shows details regarding access to the Project Site and Project Site logistics for conducting temperature screening.
- A 48-hour advance notice will be provided to all trades prior to the first day of temperature screening.

[3] Santa Clara County Public Health (June 12, 2020) COVID-19 CASES AT CONSTRUCTION SITES HIGHLIGHT NEED FOR CONTINUED VIGILANCE IN SECTORS THAT HAVE REOPENED, *available at* https://www.sccgov.org/sites/covid19/Pages/press-release-06-12-2020-cases-at-construction-sites.aspx.

2-11 Cont.

- The perimeter fence directly adjacent to the entry points will be clearly marked indicating the appropriate 6-foot social distancing position for when you approach the screening area. Please reference the Apex temperature screening site map for additional details.
- There will be clear signage posted at the project site directing you through temperature screening.
- Provide hand washing stations throughout the construction site.

Testing Procedures:

- The temperature screening being used are non-contact devices.
- Temperature readings will not be recorded.
- Personnel will be screened upon entering the testing center and should only take 1-2 seconds per individual.
- Hard hats, head coverings, sweat, dirt, sunscreen or any other cosmetics must be removed on the forehead before temperature screening.
- Anyone who refuses to submit to a temperature screening or does not answer the health screening questions will be refused access to the Project Site.
- Screening will be performed at both entrances from 5:30 am to 7:30 am.; main gate [ZONE 1] and personnel gate [ZONE 2]
- After 7:30 am only the main gate entrance [ZONE 1] will continue to be used for temperature testing for anybody gaining entry to the project site such as returning personnel, deliveries, and visitors.
- If the digital thermometer displays a temperature reading above 100.0 degrees Fahrenheit, a second reading will be taken to verify an accurate reading.

2-11 Cont.

- If the second reading confirms an elevated temperature, DHS will instruct the individual that he/she will not be allowed to enter the Project Site. DHS will also instruct the individual to promptly notify his/her supervisor and his/her human resources (HR) representative and provide them with a copy of Annex A.

Planning

- Require the development of an Infectious Disease Preparedness and Response Plan that will include basic infection prevention measures (requiring the use of personal protection equipment), policies and procedures for prompt identification and isolation of sick individuals, social distancing (prohibiting gatherings of no more than 10 people including all-hands meetings and all-hands lunches) communication and training and workplace controls that meet standards that may be promulgated by the Center for Disease Control, Occupational Safety and Health Administration, Cal/OSHA, California Department of Public Health or applicable local public health agencies.[4]

2-11 Cont.

The United Brotherhood of Carpenters and Carpenters International Training Fund has developed COVID-19 Training and Certification to ensure that Carpenter union members and apprentices conduct safe work practices. The Agency should require that all construction workers undergo COVID-19 Training and Certification before being allowed to conduct construction activities at the Project Site.

D. The DEIR's Mitigation Measures are Impermissibly Vague and Defer Critical Details

The DEIR improperly defers critical details of mitigation measures. Feasible mitigation measures for significant environmental effects must be set forth in an EIR for

[4] *See also* The Center for Construction Research and Training, North America's Building Trades Unions (April 27 2020) NABTU and CPWR COVIC-19 Standards for U.S Constructions Sites, *available at* https://www.cpwr.com/sites/default/files/NABTU_CPWR_Standards_COVID-19.pdf; Los Angeles County Department of Public Works (2020) Guidelines for Construction Sites During COVID-19 Pandemic, *available at* https://dpw.lacounty.gov/building-and-safety/docs/pw_guidelines-construction-sites.pdf.

consideration by the lead agency's decision makers and the public before certification of the EIR and approval of a project. The formulation of mitigation measures generally cannot be deferred until after certification of the EIR and approval of a project. CEQA Guidelines § 15126.4(a)(1)(B) ("…[f]ormulation of mitigation measures should not be deferred until some future time.").

Deferring critical details of mitigation measures undermines CEQA's purpose as a public information and decision-making statute. "[R]eliance on tentative plans for future mitigation after completion of the CEQA process significantly undermines CEQA's goals of full disclosure and informed decisionmaking; and[,] consequently, these mitigation plans have been overturned on judicial review as constituting improper deferral of environmental assessment." *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal. App. 4th 70, 92 ("*Communities*"). As the Court noted in *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 307, "[a] study conducted after approval of a project will inevitably have a diminished influence on decision-making. Even if the study is subject to administrative approval, it is analogous to the sort of post hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA."

A lead agency's adoption of an EIR's proposed mitigation measure for a significant environmental effect that merely states a "generalized goal" to mitigate a significant effect without committing to any specific criteria or standard of performance violates CEQA by improperly deferring the formulation and adoption of enforceable mitigation measures. *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 670; *Communities*, 184 Cal.App.4th at 93 ("EIR merely proposes a generalized goal of no net increase in greenhouse gas emissions and then sets out a handful of cursorily described mitigation measures for future consideration that might serve to mitigate the [project's significant environmental effects."); cf. *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1028-1029 (upheld EIR that set forth a range of mitigation measures to offset significant traffic impacts where performance criteria would have to be met, even though further study was needed and EIR did not specify which measures had to be adopted by city).].

The following Project mitigation measures are impermissibly vague and defer critical details:

- MM-CUL-1: Calls for development, but does not include details, of a Worker Environmental

2-11
Cont.

Awareness Program (WEAP) in order to address impacts to archeological resources;

- MM-GEO-1: Calls for a paleontologist to prepare a Paleontolgoical Resources Impact Mitigation Program (PRIMP) to mitigate unique paleontological resources but does not include any details of the PRIMP for review;
- MM-HAZ-1: Calls for incorporation of "abatement procedures" to remove asbestos, lead, etc. but does not include any specific performance standards for removal and does not include any plan in the DEIR for review; and
- MM-HAZ-2: Calls for development of a Hazardous Materials Contingency Plan (HMCP) to address potential impacts relating to soil and vapor intrusion with the 76 gas station adjacent to PCC-North, but again, fails to include any plan or any performance standards by which soil vapor would be mitigated to less than significant levels.

(DEIR, ES-10~16.)

2-11 Cont.

E. The DEIR Fails to Support Its Findings with Substantial Evidence

When new information is brought to light showing that an impact previously discussed in the DEIR but found to be insignificant with or without mitigation in the DEIR's analysis has the potential for a significant environmental impact supported by substantial evidence, the EIR must consider and resolve the conflict in the evidence. See *Visalia Retail, L.P. v. City of Visalia* (2018) 20 Cal. App. 5th 1, 13, 17; see also *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal. App. 4th 1099, 1109. While a lead agency has discretion to formulate standards for determining significance and the need for mitigation measures—the choice of any standards or thresholds of significance must be "based to the extent possible on scientific and factual data and an exercise of reasoned judgment based on substantial evidence. CEQA Guidelines § 15064(b); *Cleveland Nat'l Forest Found. v. San Diego Ass'n of Gov'ts* (2017) 3 Cal. App. 5th 497, 515; *Mission Bay Alliance v. Office of Community Inv. & Infrastructure* (2016) 6 Cal. App. 5th 160, 206. And when there is evidence that an

impact could be significant, an EIR cannot adopt a contrary finding without providing an adequate explanation along with supporting evidence. *East Sacramento Partnership for a Livable City v. City of Sacramento* (2016) 5 Cal. App. 5th 281, 302.

In addition, a determination that regulatory compliance will be sufficient to prevent significant adverse impacts must be based on a project-specific analysis of potential impacts and the effect of regulatory compliance. In *Californians for Alternatives to Toxics v. Department of Food & Agric.* (2005) 136 Cal. App. 4th 1, the court set aside an EIR for a statewide crop disease control plan because it did not include an evaluation of the risks to the environment and human health from the proposed program but simply presumed that no adverse impacts would occur from use of pesticides in accordance with the registration and labeling program of the California Department of Pesticide Regulation. *See also Ebbetts Pass Forest Watch v Department of Forestry & Fire Protection* (2008) 43 Cal. App. 4th 936, 956 (fact that Department of Pesticide Regulation had assessed environmental effects of certain herbicides in general did not excuse failure to assess effects of their use for specific timber harvesting project).

2-11 Cont.

1. *The DEIR Fails to Support its Findings on Greenhouse Gas Impacts with Substantial Evidence.*

CEQA Guidelines § 15064.4 allow a lead agency to determine the significance of a project's GHG impact via a qualitative analysis (e.g., extent to which a project complies with regulations or requirements of state/regional/local GHG plans), and/or a quantitative analysis (e.g., using model or methodology to estimate project emissions and compare it to a numeric threshold). So too, CEQA Guidelines allow lead agencies to select what model or methodology to estimate GHG emissions so long as the selection is supported with substantial evidence, and the lead agency "should explain the limitations of the particular model or methodology selected for use." CEQA Guidelines § 15064.4(c).

CEQA Guidelines sections 15064.4(b)(3) and 15183.5(b) allow a lead agency to consider a project's consistency with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

CEQA Guidelines §§ 15064.4(b)(3) and 15183.5(b)(1) make clear qualified GHG reduction plans or CAPs should include the following features:

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);

(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;

(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;

(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;

(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels;

2-11 Cont.

Collectively, the above-listed CAP features tie qualitative measures to quantitative results, which in turn become binding via proper monitoring and enforcement by the jurisdiction—all resulting in real GHG reductions for the jurisdiction as a whole, and the substantial evidence that the incremental contribution of an individual project is not cumulatively considerable.

Here, the DEIR's analysis of greenhouse gas emissions impacts is not supported by substantial evidence for all of the reasons outlined in SWAPE's April 12, 2021 letter regarding their review of the DEIR[5]:

- The DEIR utilized an incorrect and unsubstantiated quantitative analysis of emissions;
- The DEIR incorrectly relied upon an outdated quantitative GHG threshold;

[5] April 12, 2021 SWAPE Letter to Greg Sonstein re Comments on Pacific Coast Commons Specific Plan Project. Attached hereto as Exhibit D.

- The DEIR failed to identify a potentially significant GHG impact; and
- The DEIR failed to consider performance-based standards under CARB's 2017 Scoping Plan, and failed to consider performance-based standards under SCAG's RTP/SCS plan.

(Exhibit D, 20-27.)

Additionally, the DEIR needs to consider and incorporate all of the feasible mitigation measures to reduce identified GHG impacts proposed by SWAPE. (Exhibit D, 27-34.)

2. *The DEIR Fails to Support its Findings on Air Quality Impacts with Substantial Evidence.*

Second, the DEIR's Air Quality analysis is fundamentally flawed and not supported by substantial evidence for all the reasons outlined in SWAPE's comments, including:

- Use of unsubstantiated input parameters to estimate project emissions,
  - Underestimated land use sizes;
  - Failure to model all required demolition;
  - Unsubstantiated changed to acres of grading values;
  - Unsubstantiated changes to material silt content values;
  - Unsubstantiated change to hauling trip numbers;
  - Unsubstantiated changes to architectural and area coating areas;
  - Underestimated operational vehicle trip rates;
  - Unsubstantiated changes to energy use values;
  - Unsubstantiated changes to wastewater treatment system percentages;
  - Incorrect application of construction-related mitigation measures;
  - Incorrect application of mobile-related operational mitigation measures; and
  - Failing to adequately analyze diesel particulate matter health risk emissions and identify a potentially significant health risk impact.

(Exhibit D, 1-19.)

Additionally, as noted above, the DEIR fails to consider or include many feasible mitigation measures proposed by SWAPE to reduce significant air quality impacts.

2-11 Cont.

(DEIR, 27-34.) The DEIR needs to be revised and recirculated with a substantiated air quality analysis that includes all feasible mitigation measures to reduce impacts.

3. *The DEIR Fails to Support its Findings on Transportation Impacts with Substantial Evidence.*

CEQA Guidelines § 15064.3(b) requires analysis of a Project's vehicle miles traveled (VMT) impacts as part of the environmental document's transportation impacts analysis. According to the DEIR, the OPR technical guidance suggests that projects which have a VMT per capita of 15% or more below existing conditions may indicate a less than significant transportation impact relating to VMT. (DEIR, 4.13-21~2.) Assuming then this is the proper methodology, the DEIR concludes that the Project would have a less than significant VMT impact because the project is predicted to exhibit more than a 15% reduction in VMT over VMT per capita for the City as a whole, and the region. (DEIR, 4.13-22.)

The DEIR estimates a VMT per capita of 10.9 based upon the project site's location within TAZ (transportation analysis zone) 21125100—yet, it is not clear that this VMT estimate accounts for trips other than home-based VMT which is traced back to residences.[6] Home-based VMT excludes work trips and other trips not originating from residences in the Project area. Thus, the TAZ estimate is not an accurate reflection of actual (or total) VMT per capita for the TAZ cannot be relied upon to determine VMT impact significance. A home-based VMT analysis is even less supported in the case of a project that includes mixed-use development, as here, such as a hotel and retail uses where home-based VMT estimates will not accurately reflect total VMT.

2-11 Cont.

The DEIR should be revised and recirculated with a transportation analysis that includes total VMT estimates.

4. *The DEIR Fails to Support its Findings on Hazards and Hazardous Materials Impacts with Substantial Evidence.*

Appendix F of the DEIR (Phase I ESA) identifies numerous potentially hazardous waste sites in and around the Project site. Though some of these sites have received regulatory closure, the DEIR identifies at least one site "which could impact the

[6] *See, e.g., Transportation Analysis Updates in Santa Clarita* (May 19, 2020), prepared for City of Santa Clarita by Fehr & Peers, p. 15. Available at https://www.santa-clarita.com/Home/ShowDocument?id=18536.

Project site." (DEIR, 4.7-4.) The DEIR also identifies at least three other hazardous material release sites but postulates they would "not likely impact the environmental condition of the Project site. (*Id.*) Additionally, numerous UST violations were identified near the Project site; a gas station has been under ongoing operations since the 1930s which also includes environmental hazard violations for releases of petroleum products; and other multiple sources of PCE and TCE contamination were identified in the Project site area relating to manufacturing operations. (DEIR, 4.7-5.)

Despite all this evidence of potential hazardous substances release and a Phase I ESA of the site or area, the DEIR concludes that there would be no long-term operational impacts involving the release of hazardous materials. (DEIR, 4.7-21.) The City simply cannot rule out a risk to future Project site occupants from release of hazardous materials from all of these known sources without a Phase II ESA. The DEIR admits that ongoing operations of the former 76 gas station indicate a potential for release of hazardous substances, and many sources of PCE and TCE are present in the area that may require mitigation that have not been characterized at the site. This information does not support a conclusion of a less than significant impact without further studies. The DEIR should be revised and recirculated to include a Phase II ESA of the Project site that includes the surrounding area to adequately analyze whether there are potential impacts that may require mitigation.

2-11 Cont.

F. The Project Objectives are Unduly Narrow

Project objectives should not be so narrowly defined that they preclude consideration of reasonable alternatives for achieving the project's underlying purpose. *North Coast Rivers Alliance v Kawamura* (2015) 243 Cal. App. 4th 647, 668. Inconsistency with only some project objectives may not be an appropriate basis to eliminate impact-reducing project alternatives from analysis in an EIR. See CEQA Guidelines § 15126.6(c), (f). The fact that a proposed alternative does not meet all of the Project Objectives is not an appropriate basis to eliminate impact-reducing alternatives from analysis in an EIR. CEQA Guidelines § 15126.6(c), (f). Objectives should be based on the underlying purpose of the project, rather than the specific nature of the proposed project. *Habitat & Watershed Caretakers v City of Santa Cruz* (2013) 213 Cal. App. 4th 1277, 1299 (holding that the project objective of implementing a settlement agreement relating to expansion of a University of California campus was too narrow and too focused on the nature of the Project).

Here, the EIR provides extremely narrow and specific objectives that essentially only describe the proposed Project, rather than the purpose of the project:

- Objective 1 calls for maintaining existing hotel uses; and
- Objective 5 calls for increasing the efficient use of land by eliminating surface parking lots and providing parking garages that allow for sharing among hotel commercial, and residential land uses.

(DEIR, 3-18.)

Effectively, the above Project objectives so narrowly define the scope of the Project that it curtails any meaningful analysis or consideration of Project alternatives that could substantially reduce the Project's environmental impacts. A revised and recirculated DEIR should include amended Project objectives that do not circumscribe the EIR's Alternatives' analysis.

III. THE PROJECT VIOLATES THE STATE PLANNING AND ZONING LAW AS WELL AS THE CITY'S GENERAL PLAN

A. Background Regarding the State Planning and Zoning Law

2-11 Cont.

Each California city and county must adopt a comprehensive, long-term general plan governing development. *Napa Citizens for Honest Gov. v. Napa County Bd. of Supervisors* (2001) 91 Cal. App.4th 342, 352, citing Gov. Code §§ 65030, 65300. The general plan sits at the top of the land use planning hierarchy (See *DeVita v. County of Napa* (1995) 9 Cal. App. 4th 763, 773), and serves as a "constitution" or "charter" for all future development. *Lesher Communications, Inc. v. City of Walnut Creek* (1990) 52 Cal. App. 3d 531, 540.

General plan consistency is "the linchpin of California's land use and development laws; it is the principle which infused the concept of planned growth with the force of law." See *Debottari v. Norco City Council* (1985) 171 Cal. App. 3d 1204, 1213.

State law mandates two levels of consistency. First, a general plan must be internally or "horizontally" consistent: its elements must "comprise an integrated, internally consistent and compatible statement of policies for the adopting agency." (See Gov. Code § 65300.5; *Sierra Club v. Bd. of Supervisors* (1981) 126 Cal. App. 3d 698, 704.) A general plan amendment thus may not be internally inconsistent, nor may it cause the general plan as a whole to become internally inconsistent. See *DeVita*, 9 Cal. App. 4th at 796 fn. 12.

Second, state law requires "vertical" consistency, meaning that zoning ordinances and other land use decisions also must be consistent with the general plan. (See Gov. Code § 65860(a)(2) [land uses authorized by zoning ordinance must be "compatible with the objectives, policies, general land uses, and programs specified in the [general] plan."]; see also *Neighborhood Action Group v. County of Calaveras* (1984) 156 Cal. App. 3d 1176, 1184.) A zoning ordinance that conflicts with the general plan or impedes achievement of its policies is invalid and cannot be given effect. See *Lesher*, 52 Cal. App. 3d at 544.

State law requires that all subordinate land use decisions, including conditional use permits, be consistent with the general plan. See Gov. Code § 65860(a)(2); *Neighborhood Action Group*, 156 Cal. App. 3d at 1184.

A project cannot be found consistent with a general plan if it conflicts with a general plan policy that is "fundamental, mandatory, and clear," regardless of whether it is consistent with other general plan policies. See *Endangered Habitats League v. County of Orange* (2005) 131 Cal. App. 4th 777, 782-83; *Families Unafraid to Uphold Rural El Dorado County v. Bd. of Supervisors* (1998) 62 Cal. App. 4th 1332, 1341-42 ("*FUTURE*").

Moreover, even in the absence of such a direct conflict, an ordinance or development project may not be approved if it interferes with or frustrates the general plan's policies and objectives. See *Napa Citizens*, 91 Cal. App. 4th at 378-79; see also *Lesher*, 52 Cal. App. 3d at 544 (zoning ordinance restricting development conflicted with growth-oriented policies of general plan).

B. The DEIR Fails to Demonstrate Consistency with SCAG's RTP/SCS Plan

Senate Bill No. 375 requires regional planning agencies to include a sustainable communities strategy in their regional transportation plans. Gov. Code § 65080, sub.(b)(2)(B).) CEQA Guidelines § 15125(d) provides that an EIR "shall discuss any inconsistencies between the proposed project and…regional plans. Such regional plans include…regional transportation plans." Thus, CEQA requires analysis of any inconsistencies between the Project and the relevant RTP/SCS plan.

In September 2008, SB 375 (Gov. Code § 65080(b) et seq.) was instituted to help achieve AB 32 goals through strategies including requiring regional agencies to prepare a Sustainable Communities Strategy ("SCS") to be incorporated into their Regional Transportation Plan ("RTP"). The RTP links land use planning with the regional

2-11 Cont.

transportation system so that the region can grow smartly and sustainably, while also demonstrating how the region will meet targets set by CARB that reduce the per capita GHG emission from passenger vehicles in the region.

According to SWAPE's comments, the DEIR failed to consider performance-based standards under the RTP/SCS plan. The DEIR failed to evaluate whether the Project is consistent with per capita GHG emission targets, or daily vehicle miles traveled. (Ex. D, 24.) And according to SWAPE's analysis and conclusion, the Project exceeds both per capita GHG emissions targets and daily VMT per capita—thus, the Project is not consistent with SCAG's RTP/SCS Plan.

C. The DEIR Fails to Demonstrate Consistency with the State Housing Law's Regional Housing Needs Assessment Requirements and the City's Obligations to Fulfill those Requirements in its Housing Element

State law requires that jurisdictions provide their fair share of regional housing needs and adopt a general plan for future growth (California Government Code Section 65300). The California Department of Housing and Community Development (HCD) is mandated to determine state-wide housing needs by income category for each Council of Governments (COG) throughout the state. The housing need is determined based on four broad household income categories: very low (households making less than 50 percent of median family income), low (50 to 80 percent of median family income), moderate (80 to 120 percent of median family income), and above moderate (more than 120 percent of median family income). The intent of the future needs allocation by income groups is to relieve the undue concentration of very low and low-income households in a single jurisdiction and to help allocate resources in a fair and equitable manner.

CEQA requires the DEIR analyze the Project's consistency with the State's housing goals. CEQA Guidelines section 15125(d) requires that an environmental impact report "discuss any inconsistencies between the proposed project and applicable general plans, specific plans and regional plans. *See also Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal. App. 5th 467, 543.

A Court "[w]hen reviewing whether a discussion is sufficient to satisfy CEQA, . . . the EIR (1) includes sufficient detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issues the proposed project raises [citation omitted], and (2) makes a reasonable effort to substantively

2-11 Cont.

connect a project's air quality impacts to likely health consequences." (*Sierra Club v. County of Fresno* (2018) 6 Cal. 5th 502, 510 [citing *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405.]; see also PRC §§ 21002.1(e), 21003(b).) The Court may determine whether a CEQA environmental document sufficiently discloses information required by CEQA de novo as "noncompliance with the information disclosure provisions" of CEQA is a failure to proceed in a manner required by law. (PRC § 21005(a); see also *Sierra Club v. County of Fresno* (2018) 6 Cal. 5th 502, 515.)

SCAG is the COG for Los Angeles County and has determined that the City's RHNA for the 6th Cycle allocation period is 189 units for very low income residents, 88 units for low income residents, 84 units for moderate income residents, and 131 unit for above moderate income residents for a total of 492 housing units.[7]

First, the City fails to analyze consistency with the latest RHNA allocation in the DEIR. (DEIR, 4.11-6.) Second, the Project fails to include *any* affordable housing units as part of the Project for residents with income below above moderate. The City is required to meet the housing needs of all of city residents under the state housing law. While the DEIR calls for a provision in a future development agreement to include some affordable housing units, at this stage of the Project, none are included and no development agreement has been drafted.

The DEIR should be revised and recirculated with an affordable housing component.

2-11 Cont.

IV. CONCLUSION

Commenters request that the City deny the Project's proposed Site Plan Review and any other discretionary approvals the City finds necessary and order the revision and recirculation of the Project's environmental impact report to address the aforementioned concerns.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

2-12

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

2-12 Cont.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[4] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14-15.
[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.

[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

2

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added).[12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin

Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	**16.47**	**11.17**
Minimum	**10.80**	**10.80**
Maximum	**19.80**	**14.70**
Range	**9.00**	**3.90**

[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

2-13 Cont.

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 – 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989 – 1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 - 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

2

2-13 Cont.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

2-13
Cont.

3

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

2-13 Cont.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

2-13 Cont.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Subject: Comments on the Pacific Coast Commons Specific Plan (SCH No. 2020050508)

Dear Mr. Sonstein,

We have reviewed the February 2021 Draft Environmental Impact Report ("DEIR") for the Pacific Coast Commons Specific Plan ("Project") located in the City of El Segundo ("City"). The Project proposes to the adoption of a Specific Plan that would allow for the continued operation of 596 hotel rooms and construction of 263 housing units, 11,252-SF of commercial/retail uses, and 792 parking stalls on the 6.385-acre site. 2-14

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's air quality analysis relies on emissions calculated with CalEEMod.2016.3.2 (p. 4.2-1).[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes

[1] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.

be justified by substantial evidence. Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

When reviewing the Project's CalEEMod output files, provided in Appendix C-1, "CalEEMod Outputs," and Appendix C-2, "Health Risk Assessment Report," to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. As a result, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Underestimated Land Use Sizes

According to the DEIR, the Project proposes to construct 327,021-SF of residential development, 11,252-SF of commercial/retail uses, and 792 parking spaces (p. 3-2). However, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and "Pacific Coast Commons Specific Plan Project Mit" models include only 314,659-SF of residential space, 11,000-SF of commercial/retail space, and 763 parking spaces (see excerpt below) (Appendix C-1, pp. 3, 51, 95; Appendix C-2, pp. 33).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
Enclosed Parking with Elevator	763.00	Space	0.00	305,200.00
Other Asphalt Surfaces	12.65	1000sqft	0.00	12,650.00
High Turnover (Sit Down Restaurant)	3.70	1000sqft	0.00	3,700.00
Apartments Mid Rise	263.00	Dwelling Unit	0.00	314,659.00
Regional Shopping Center	7.30	1000sqft	5.35	7,300.00

2-14 Cont.

As you can see in the excerpt above, the proposed residential, commercial/retail, and parking land uses are underestimated by 12,362-SF, 252-SF, and 29 spaces, respectively. These underestimations present an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[2] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Thus, by underestimating the sizes of the proposed residential, commercial/retail, and parking land uses, the models underestimate the Project's emissions and should not be relied upon to determine Project significance.

[2] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/01_user-39-s-guide2016-3-1.pdf?sfvrsn=2, p. 17

Failure to Model All Required Demolition

According to the CalEEMod User's Guide, "[h]aul trips are based on the amount of material that is demolished, imported or exported assuming a truck can handle 16 cubic yards of material."[3] Therefore, the air model calculates a default number of hauling trips based upon the amount of demolition material inputted into the model. According to the DEIR:

> "During Phase 1, it was assumed that *41,660-SF of buildings* and *6,000-SF of pavement* would require demolition. For Phases 2 and 3, it was assumed that a total of *131,000 square feet of pavement* would require demolition" (p. 4.2-25).

As such, the models should have included at least 178,660-SF of demolition.[4] When correctly inputting 178,660-SF of building demolition, the model calculates a default demolition hauling trip number of 812 trips. However, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include only 381 total default hauling trips, which were artificially increased to 400 hauling trips (see excerpts below) (Appendix C-1, pp. 13, 61, 105; Appendix C-2, pp. 42).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	189.00	200.00
tblTripsAndVMT	HaulingTripNumber	192.00	200.00

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number
Demolition - Phase 1	6	80.00	20.00	200.00
Site Preparation - Phase 1	7	50.00	10.00	0.00
Grading - Phase 1	6	80.00	10.00	0.00
Building Construction - Phase 1	9	120.00	30.00	0.00
Paving - Phase 1	6	40.00	10.00	0.00
Architectural Coating - Phase 1	1	80.00	20.00	0.00
Demolition - Phases 2 and 3	6	100.00	40.00	200.00
Site Preparation - Phases 2 and 3	7	120.00	20.00	0.00
Grading - Phases 2 and 3	6	160.00	20.00	1,720.00
Building Construction - Phases 2 and 3	9	300.00	60.00	0.00
Paving - Phases 2 and 3	6	80.00	20.00	0.00
Architectural Coating - Phases 2 and 3	1	240.00	40.00	0.00

2-14 Cont.

[3] http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14

[4] Calculated: (41,660-SF of buildings demolition) + (6,000-SF of pavement demolition) + (131,000-SF of pavement demolition) = 178,660-SF of demolition.

3

As you can see in the excerpts above, the ***default*** number of demolition hauling trips was underestimated by 431 trips.[5] As such, the models fail to include the total amount of demolition required for the Project.

This underestimation presents an issue, as the total amount of demolition material is used by CalEEMod to determine emissions associated with this phase of construction; the three primary operations that generate dust emission during the demolition phase are mechanical or explosive dismemberment, site removal of debris, and on-site truck traffic on paved and unpaved road.[6] By failing to include the total amount of required demolition, the models underestimate emissions associated with fugitive dust, site removal, as well as exhaust from hauling trucks traveling to and from the site, and should not be relied upon to determine the significance of the Project's air quality impacts.

Unsubstantiated Changes to Acres of Grading Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include reductions to the default acres of grading values (see excerpt below) (Appendix C-1, pp. 6, 54, 98; Appendix C-2, pp. 36).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	21.50	0.74
tblGrading	AcresOfGrading	21.00	3.14

As you can see in the excerpt above, the acres of grading values were reduced by approximately 97%, from the default value of 21.5- to 0.74-acres, and 85%, from the default value of 21- to 3.14-acres. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[7] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "17,000 CY of soil export during Phase 2" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34). Furthermore, regarding the acres of grading value, the DEIR states:

> "During grading activities, fugitive dust can be generated from the movement of dirt on the Project site. CalEEMod estimates dust from dozers moving dirt around, dust from graders or scrapers leveling the land, and loading or unloading dirt into haul trucks. Each of those activities is calculated differently in CalEEMod, ***based on the number of acres traversed by the grading equipment***" (emphasis) (p. 4.2-23).

However, these reductions remain unsupported for two reasons. First, the justification provided by the "User Entered Comments & Non-Default Data" table fails to address the revised acres of grading value. Second, according to the CalEEMod User's Guide:

> "[T]he dimensions (e.g., length and width) of the grading site have no impact on the calculation, only the total area to be graded. In order to properly grade a piece of land multiple passes with

2-14 Cont.

[5] Calculated: (812 demolition hauling trips) – (381 trips demolition hauling trips) = 431 demolition hauling trips.
[6] CalEEMod User Guide, Appendix A, p. 11, *available at:* http://www.caleemod.com/
[7] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

equipment may be required. The acres is based on the equipment list and days in grading or site preparation phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday."[8]

Thus, as the dimensions of the Project site have no impact on the acres of grading value, and the DEIR fails to substantiate this change, we cannot verify the revised acres of grading values.

These unsubstantiated reductions present an issue, as CalEEMod uses the acres of grading value to estimate the dust emissions associated with grading.[9] Thus, by including unsubstantiated reductions to the default acres of grading values, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Material Moisture Content Bulldozing Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include several changes to the default material moisture content bulldozing values (see excerpt below) (Appendix C-1, pp. 6, 54, 98; Appendix C-2, pp. 36).

Table Name	Column Name	Default Value	New Value
tblGrading	MaterialMoistureContentBulldozing	7.90	17.00
tblGrading	MaterialMoistureContentBulldozing	7.90	17.00
tblGrading	MaterialMoistureContentBulldozing	7.90	17.00

As you can see in the excerpt above, the material moisture content bulldozing values were increased from the default value of 7.9% to 17%. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[10] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "17,000 CY of soil export during Phase 2" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34).

However, this change remains unsupported for two reasons. First, the justification provided by the "User Entered Comments & Non-Default Data" table fails to address the revised material moisture content bulldozing values. Second, the DEIR and associated documents fail to mention or justify these changes whatsoever.

2-14 Cont.

[8] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[9] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[10] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

These unsubstantiated changes present an issue, as CalEEMod uses the material moisture content bulldozing values to calculate the dust emission factor associated with bulldozing.[11] Specifically, CalEEMod utilizes the following equations:[12]

$$EF_{TSP} = \frac{C_{TSP} \times s^{1.2}}{M^{1.3}}, \text{ and } EF_{PM2.5} = EF_{TSP} \times F_{PM2.5}$$

$$EF_{PM15} = \frac{C_{PM15} \times s^{1.5}}{M^{1.4}}, \text{ and } EF_{PM10} = EF_{PM15} \times F_{PM10}$$

Where:
EF = emission factor (lb/hr)
C = arbitrary coefficient used by AP-42
M = material moisture content (%)
S = material silt content (%)
F = scaling factor

As demonstrated above, there is an inverse relationship between material moisture content and dust emission factors. In other words, *when the material moisture content percentage increases, the dust emission factor decreases*. As such, by including unsubstantiated increases to the material moisture content values, the models may underestimate the emissions associated with bulldozing. Thus, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Material Silt Content Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and the "Pacific Coast Commons Specific Plan Project Mit" models include several reductions to the default material silt content values (see excerpt below) (Appendix C-1, pp. 6, 54, 98; Appendix C-2, pp. 36).

Table Name	Column Name	Default Value	New Value
tblGrading	MaterialSiltContent	6.90	3.30
tblGrading	MaterialSiltContent	6.90	3.30
tblGrading	MaterialSiltContent	6.90	3.30
tblGrading	MaterialSiltContent	6.90	3.30

As you can see in the excerpt above, the material silt content values were increased from the default value to 6.9% to 3.3%. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[13] According to the "User Entered Comments & Non-Default Data" table, the

2-14 Cont.

[11] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.
[12] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.
[13] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

justification provided for these changes is: "17,000 CY of soil export during Phase 2" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34).

However, this change remains unsupported for two reasons. First, the justification provided by the "User Entered Comments & Non-Default Data" table fails to address the revised material silt content values. Second, the DEIR and associated documents fail to mention or justify these changes whatsoever.

These unsubstantiated changes present an issue, because CalEEMod uses the material silt content values to calculate the dust emission factor associated with bulldozing.[14] Specifically, CalEEMod utilizes the following equations:[15]

$$EF_{TSP} = \frac{C_{TSP} \times s^{1.2}}{M^{1.3}}, \text{ and } EF_{PM2.5} = EF_{TSP} \times F_{PM2.5}$$

$$EF_{PM15} = \frac{C_{PM15} \times s^{1.5}}{M^{1.4}}, \text{ and } EF_{PM10} = EF_{PM15} \times F_{PM10}$$

Where:
EF = emission factor (lb/hr)
C = arbitrary coefficient used by AP-42
M = material moisture content (%)
S = material silt content (%)
F = scaling factor

As demonstrated above, there is a direct relationship between material silt content and dust emission factors. In other words, *when the material silt content percentage decreases, the dust emission factor decreases as well*. As such, by including unsubstantiated increases to the material silt content values, the models may underestimate the emissions associated with bulldozing. Thus, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

2-14 Cont.

Unsubstantiated Changes to Hauling Trip Numbers

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes several changes to the default hauling trip numbers (see excerpt below) (Appendix C-1, pp. 6-7, 54, 98).

[14] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.
[15] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 10.

7

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	189.00	200.00
tblTripsAndVMT	HaulingTripNumber	192.00	200.00
tblTripsAndVMT	HaulingTripNumber	2,125.00	1,720.00

As you can see in the excerpt above, the number of hauling trips was collectively reduced by 386 trips, from the cumulative default value of 2,506 trips to 2,120 trips.[16] As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[17] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Updated per applicant" (Appendix C-1, pp. 4, 52, 96). Furthermore, the DEIR states:

> "Haul truck trips during the demolition and grading phases were based on demolition and earthwork quantities provided" (p. 4.2-25).

However, these justifications are insufficient, as the DEIR and associated documents fail to provide the calculations or explain how the revised hauling trip numbers were derived "based on demolition and earthwork quantities." As such, we cannot verify the revised hauling trip numbers.

These unsubstantiated changes present an issue, as CalEEMod uses number of hauling trips to estimate the construction-related emissions associated with on-road vehicles.[18] Thus, by including unsubstantiated changes to the default hauling trip numbers, the model may underestimate the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance.

2-14 Cont.

Unsubstantiated Changes to Architectural and Area Coating Areas

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" and "Pacific Coast Commons Specific Plan Project Mit" models include several reductions to the default architectural and area coating areas (see excerpt below) (Appendix C-1, pp. 5, 52-53, 96-97; Appendix C-2, pp. 34-35).

Table Name	Column Name	Default Value	New Value
tblArchitecturalCoating	ConstArea_Residential_Exterior	212,395.00	0.00
tblArchitecturalCoating	ConstArea_Residential_Exterior	212,395.00	212,213.00
tblArchitecturalCoating	ConstArea_Residential_Interior	637,184.00	0.00
tblArchitecturalCoating	ConstArea_Residential_Interior	637,184.00	636,338.00
tblAreaCoating	Area_Parking	19071	1959

[16] Calculated: (189 + 192 + 2,125 default hauling trips) – (200 + 200 + 1,720 revised hauling trips) = 386 net decrease in hauling trips.
[17] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[18] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 34.

As you can see in the excerpt above, the architectural coating areas were reduced by 850,607-SF, from the cumulative default value of 1,699,158- to 848,551-SF;[19] and the area coating area for the proposed parking land use was reduced by 17,112-SF, from the default value of 19,701- to 1,959-SF.[20] As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[21] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Updated SF per phase" (Appendix C-1, pp. 4, 52, 96; Appendix C-2, pp. 34). However, these reductions remain unsupported for two reasons.

First, the DEIR and associated documents fail to mention or justify the changes to the construction-related architectural coating areas whatsoever. As such, we cannot verify the revised architectural coating areas.

Second, regarding the operational area coating areas, the DEIR states:

> "*Consistent with CalEEMod defaults*, it is assumed that the residential surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating. For nonresidential land uses (e.g., retail, community, and commercial areas), it is assumed that the surface area for painting equals 2.0 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating. *For the parking garage, the architectural coating area is assumed to be 6% of the total square footage, consistent with the supporting CalEEMod studies provided as an appendix to the CalEEMod User's Guide*" (emphasis added) (p. 4.2-28).

As demonstrated above, the DEIR claims that the Project's area coating areas are consistent with CalEEMod defaults. Thus, as the area coating area was reduced from the default value, the change is unsubstantiated and inconsistent with the information provided in the DEIR. As such, we cannot verify the revised area coating area.

These unsubstantiated reductions present an issue, as CalEEMod uses architectural and area coating areas to calculate ROG emissions associated with painting and reapplication.[22] Thus, by including unsubstantiated reductions to the default architectural and area coating areas, the models may underestimate the Project's area-source emissions and should not be relied upon to determine Project significance.

2-14 Cont.

[19] Calculated: (212,395-SF + 212,395-SF + 637,184-SF + 637,184-SF default architectural coating areas) – (212,213-SF + 636,338-SF revised architectural coating areas) = 850,607-SF net decrease in architectural coating areas.
[20] 19,70-SF default area coating area –1,959-SF revised area coating area = 17,112-SF net decrease inn area coating area.
[21] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[22] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 35, 42.

9

Underestimated Operational Vehicle Trip Rates

According to the Traffic Impact Analysis ("TIA"), provided in Appendix J-1 to the DEIR, the Project is expected to generate approximately 2,517 average daily vehicle trips (see excerpt below) (p. 30, Table 4).

Land Use	ITE Land Use Code	Size	Trip Generation Rates [a]							Daily
			Daily	AM Peak Hour			PM Peak Hour			
				Rate	In%	Out%	Rate	In%	Out%	
PROPOSED PROJECT

TOTAL PROJECT EXTERNAL VEHICLE TRIPS										2,517

2-14 Cont.

As such, the models should have included trip rates that reflect the number of average daily operational vehicle trips estimated by the TIA. However, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes only 2,506.08 weekday and 2,271.19 Saturday vehicle trips (see excerpt below) (Appendix C-1, pp. 42, 90, 134).

Land Use	Average Daily Trip Rate		
	Weekday	Saturday	Sunday
Apartments Mid Rise	1,357.08	1,304.48	1196.65
Enclosed Parking with Elevator	0.00	0.00	0.00
High Turnover (Sit Down Restaurant)	887.00	1,104.78	919.71
Other Asphalt Surfaces	0.00	0.00	0.00
Regional Shopping Center	262.00	306.60	154.83
Total	2,506.08	2,715.86	2,271.19

As you can see in the excerpt above, the weekday and Sunday trip numbers are underestimated by approximately 11- and 246-trips, respectively. As such, the trip rates inputted into the proposed land use models are underestimated and inconsistent with the information provided by the TIA.

10

These inconsistencies present an issue, as CalEEMod uses the operational vehicle trip rates to calculate the emissions associated with the Project's operational on-road vehicles.[23] Thus, by including underestimated operational vehicle trip rates, the model underestimates the Project's mobile-source operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Energy Use Values

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes several reductions to the default energy use values (see excerpt below) (Appendix C-1, pp. 5-6, 53, 97).

Table Name	Column Name	Default Value	New Value
tblEnergyUse	T24E	179.76	176.16
tblEnergyUse	T24E	3.92	3.50
tblEnergyUse	T24E	8.71	7.78
tblEnergyUse	T24E	2.93	2.62
tblEnergyUse	T24NG	5,911.46	5,615.89
tblEnergyUse	T24NG	78.56	77.77
tblEnergyUse	T24NG	0.95	0.94

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[24] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Assume compliance with 2019 Title 24 Standards" (Appendix C-1, pp. 4, 52, 96). Furthermore, regarding 2019 Title 24 Standards, the DEIR states:

> "CalEEMod assumes compliance with the 2016 Title 24 Building Energy Efficiency Standards. The default values were updated to reflect the more stringent 2019 Title 24 Building Energy Efficiency Standards, which became effective on January 1, 2020" (p. 4.2-28).

However, these justifications are insufficient. Simply because the 2019 Title 24 standards ***expect*** a reduction in building energy consumption does not ***guarantee*** that these reductions would be implemented locally on the Project site. Absent additional information demonstrating that these reductions would be achieved through the implementation, monitoring, and enforcement of energy-related mitigation measures, we are unable to verify the revised energy use values inputted into the model.

These unsubstantiated reductions present an issue, as CalEEMod uses the energy use values to calculate the Project's emissions associated with building electricity and non-hearth natural gas usage.[25] By including unsubstantiated changes to the default energy use values, the model may underestimate the Project's energy-source operational emissions and should not be relied upon to determine Project significance.

[25] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 43

Unsubstantiated Changes to Wastewater Treatment System Percentages

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes several manual changes to the default wastewater system percentages (see excerpt below) (Appendix C-1, pp. 8, 55-56, 99-100).

Table Name	Column Name	Default Value	New Value
tblWater	AerobicPercent	87.46	100.00
tblWater	AerobicPercent	87.46	100.00
tblWater	AerobicPercent	87.46	100.00
tblWater	AerobicPercent	87.46	100.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	AnaerobicandFacultativeLagoonsPercent	2.21	0.00
tblWater	SepticTankPercent	10.33	0.00
tblWater	SepticTankPercent	10.33	0.00
tblWater	SepticTankPercent	10.33	0.00
tblWater	SepticTankPercent	10.33	0.00

As you can see in the excerpt above, the model assumes that the Project's wastewater would be treated 100% aerobically. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[26] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is: "Assume 100% aerobic" (Appendix C-1, pp. 4, 52, 96). However, these changes remain unsupported. According to the DEIR:

> "Water consumption estimates for both indoor and outdoor water use and *associated electricity consumption from water use and wastewater generation were estimated using default values in CalEEMod*" (p. 4.6-27).

As demonstrated above, the DEIR claims that the electricity consumption from wastewater generation was estimated using the CalEEMod default values. Thus, the changes to the wastewater treatment system percentages are unsubstantiated and inconsistent with the information provided in the DEIR. As such, we cannot verify the revised values.

These inconsistencies present an issue, as each type of wastewater treatment system is associated with different GHG emission factors, which are used by CalEEMod to calculate the Project's total GHG emissions.[27] Thus, by including unsubstantiated changes to the default wastewater treatment system percentages, the model may underestimate the Project's GHG emissions and should not be relied upon to determine Project significance.

12

Incorrect Application of Construction-Related Mitigation Measures

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes the following construction-related mitigation measures (see excerpt below) (Appendix C-1, pp. 14, 62, 106):

3.1 Mitigation Measures Construction

Replace Ground Cover
Water Exposed Area

Furthermore, review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project Mit" model includes the following construction-related mitigation measure (see excerpt below) (Appendix C-2, pp. 43):

3.1 Mitigation Measures Construction

Water Exposed Area

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[28] According to the "User Entered Comments and Non-Default Data" table for the "Pacific Coast Commons Specific Plan Project" model, the justification provided for the inclusion of these measures is: "Water three times daily and replace ground cover" (Appendix C-1, pp. 4, 52, 96). However, no justification was provided by the "User Entered Comments and Non-Default Data" table for the "Pacific Coast Commons Specific Plan Project Mit" model. Furthermore, the DEIR states:

> "The proposed Project would be required to comply with SCAQMD Rule 403 to control dust emissions generated during the grading activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering of the active sites three times per day depending on weather conditions" (p. 4.2-34).

However, the inclusion of the above-mentioned construction-related mitigation measures remains unsupported. Simply because the DEIR states that the Project would comply with SCAQMD Rule 403 does not justify the inclusion of the above-mentioned construction-related mitigation measures in the models. According to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on mitigation measures:

> "By definition, *mitigation measures are not part of the original project design*. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the

2-14 Cont.

[28] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9.

project has undergone environmental review and are *above-and-beyond existing laws, regulations, and requirements* that would reduce environmental impacts" (emphasis added).[29]

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on the Project's compliance with SCAQMD Rule 403, is unsubstantiated. By including construction-related mitigation measures without properly committing to their implementation, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Incorrect Application of Mobile-Related Operational Mitigation Measures

Review of the CalEEMod output files demonstrates that the "Pacific Coast Commons Specific Plan Project" model includes the following mobile-, water-, and waste-related operational mitigation measures (see excerpt below) (Appendix C-1, pp. 42, 47, 49, 90, 134):

Mobile-Related:

4.1 Mitigation Measures Mobile

Improve Destination Accessibility
Increase Transit Accessibility
Improve Pedestrian Network

Water-Related:

7.1 Mitigation Measures Water

Apply Water Conservation Strategy

Waste-Related:

8.1 Mitigation Measures Waste

Institute Recycling and Composting Services

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[30] According to the "User Entered Comments and Non-Default Data" table, the justifications provided for the inclusion of the mobile-, water-, and waste-related measures are: "Increase transit accessibility (0.2 miles) and improve pedestrian network," "Reduce water consumption by 20% per CalGreen," and "Assume 50% waste disposed per AB 939" (Appendix C-1, pp. 4, 52, 96). However, the inclusion of these operational mitigation measures remains unsupported for three reasons.

2-14 Cont.

[29] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 5.
[30] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9.

14

First, the DEIR fails to mention or justify the inclusion of the above-mentioned operational mitigation measures.

Second, the inclusion of these operational mitigation measures, based on the Project's compliance with existing policies and regulations, is unsupported. As previously stated, according to the AEP *CEQA Portal Topic Paper* on mitigation measures:

> "By definition, *mitigation measures are not part of the original project design*. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are *above-and-beyond existing laws, regulations, and requirements* that would reduce environmental impacts" (emphasis added).[31]

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on the Project's compliance with existing policies and regulations, is unsubstantiated.

Third, AEP guidance states:

> "While not "mitigation", a good practice is *to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP)*. Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, *it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact*" (emphasis added).[32]

As you can see in the excerpts above, design features that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the above-mentioned mobile-, water-, and waste-related operational measures are not formally included as mitigation measures, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site. As a result, the inclusion of the above-mentioned operational mitigation measures in the model is incorrect. By including several operational mitigation measures without properly committing to their implementation, the model may underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

2-14 Cont.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR concludes that the proposed Project would result in a less-than-significant health risk impact based on a quantified construction health risk analysis ("HRA"). Specifically, the DEIR estimates that

[31] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 5.
[32] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.

Project construction would result in a mitigated excess cancer risk of 4.23 in one million, which would not exceed the threshold of 10 in one million (see excerpt below) (p. 4.2-38, Table 4.2-13).

Table 4.2-13. Summary of Maximum Cancer and Chronic Health Risks - Mitigated

Impact Analysis	Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Maximally Exposed Individual Resident					
Construction HRA	Cancer Risk	Per Million	4.23	10	Less than Significant
	Chronic Hazard Index	Index Value	0.002	1.0	Less than Significant

Source: See Appendix C-2 for complete results.
Notes: CEQA = California Environmental Quality Act; HRA = Health Risk Assessment

However, the DEIR's evaluation of the Project's potential health risk impacts, as well as the less-than-significant impact conclusion, is incorrect for three reasons.

First, the DEIR's construction HRA is incorrect, as it relies upon an exhaust PM_{10} estimate from a flawed air model (Appendix C-2, p. 9). As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the CalEEMod Outputs as Appendix C-1 and the HRA Report as Appendix C-2 to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR and associated documents. As a result, the construction HRA utilizes an underestimated diesel particulate matter ("DPM") concentration to calculate the cancer risk associated with Project construction. As such, the DEIR underestimates the Project's construction-related cancer risk and should not be relied upon to determine Project significance.

Second, the DEIR fails to evaluate the Project's operational toxic air contaminants ("TACs") and associated health risk impacts. This is incorrect, as the TIA indicates that the proposed land uses are expected to generate approximately 2,517 average daily vehicle trips, which will generate additional exhaust emissions and continue to expose nearby sensitive receptors to DPM emissions (p. 30, Table 4). The DEIR fails to discuss the potential TACs associated with Project operation or indicate the concentrations at which such pollutants would trigger adverse health effects. Without making a reasonable effort to connect the Project's operational TAC emissions to the potential health risks posed to nearby receptors, the DEIR is inconsistent with CEQA's requirement to correlate the increase in emissions generated by the Project with the potential adverse impacts on human health.

Third, the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015, as referenced by HRA Report (Appendix C-2, p. 7).[33] The OEHHA document recommends that exposure from projects lasting more than 6 months be evaluated for the duration of the project and recommends that an exposure duration of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident ("MEIR").[34] Even though we were not provided with the expected lifetime of

2-14 Cont.

[33] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* http://oehha.ca.gov/air/hot_spots/hotspots2015.html
[34] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* http://oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf, p. 8-6, 8-15

the Project, we can reasonably assume that the Project will operate for at least 30 years, if not more. Therefore, we recommend that health risk impacts from Project operation also be evaluated, as a 30-year exposure duration vastly exceeds the 6-month requirement set forth by OEHHA. This recommendation reflects the most recent state health risk policies, and as such, we recommend that an analysis of health risk impacts posed to nearby sensitive receptors from Project operation be included in an updated EIR for the Project.

Fourth, while the DEIR includes an HRA evaluating the potential health risk impacts posed by Project construction to nearby, existing receptors, the HRA fails to evaluate the ***cumulative*** lifetime cancer risk to nearby, existing receptors as a result of all phases of Project ***construction and operation together***. According to OEHHA guidance, as referenced by the HRA Report, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location" (Appendix C-2, p. 7).[35] However, the DEIR's HRA fails to sum each age bin to evaluate the total cancer risk over the course of Project construction and operation. This is incorrect and, thus, an updated EIR should be prepared to quantify the cumulative excess cancer risk posed by Project construction and operation to nearby, existing receptors, and compare it to the SCAQMD threshold of 10 in one million.

Screening-Level Assessment Indicates a Potentially Significant Health Risk Impact

In order to conduct our screening-level risk assessment we relied upon AERSCREEN, which is a screening level air quality dispersion model.[36] The model replaced SCREEN3, and AERSCREEN is included in the OEHHA[37] and the California Air Pollution Control Officers Associated (CAPCOA)[38] guidance as the appropriate air dispersion model for Level 2 health risk screening assessments ("HRSAs"). A Level 2 HRSA utilizes a limited amount of site-specific information to generate maximum reasonable downwind concentrations of air contaminants to which nearby sensitive receptors may be exposed. If an unacceptable air quality hazard is determined to be possible using AERSCREEN, a more refined modeling approach is required prior to approval of the Project.

We prepared a preliminary HRA of the Project's operational health risk impact to sensitive receptors using the annual PM_{10} exhaust estimates from the DEIR's annual CalEEMod output files, consistent with the HRA Report's methodology (Appendix C-2, p. 9). Consistent with recommendations set forth by OEHHA, we used a residential exposure duration of 30 years, starting from the 3rd trimester stage of life. Subtracting the 1,034-day construction period from the total residential duration of 30 years, we assumed that after Project construction, the sensitive receptor would be exposed to the Project's operational DPM for an additional 27.17 years, approximately. The DEIR's CalEEMod model indicates that operational activities will generate approximately 87 pounds of DPM per year of operation. The AERSCREEN model relies on a continuous average emission rate to simulate maximum downward

2-14 Cont.

[38] CAPCOA (July 2009) Health Risk Assessments for Proposed Land Use Projects, http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA_HRA_LU_Guidelines_8-6-09.pdf.

17

concentrations from point, area, and volume emission sources. To account for the variability in equipment usage and truck trips over Project operation, we calculated an average DPM emission rate by the following equation.

$$Emission\ Rate\ \left(\frac{grams}{second}\right) = \frac{87.4\ lbs}{365\ days} \times \frac{453.6\ grams}{lbs} \times \frac{1\ day}{24\ hours} \times \frac{1\ hour}{3{,}600\ seconds} = \mathbf{0.00126\ g/s}$$

Using this equation, we estimated an operational emission rate of 0.00126 g/s. Operation was simulated as a 6.39-acre rectangular area source in AERSCREEN, with dimensions of 256 meters by 101 meters. A release height of three meters was selected to represent the height of stacks of operational equipment and other heavy-duty vehicles, and an initial vertical dimension of one and a half meters was used to simulate instantaneous plume dispersion upon release. An urban meteorological setting was selected with model-default inputs for wind speed and direction distribution.

The AERSCREEN model generates maximum reasonable estimates of single-hour DPM concentrations from the Project Site. EPA guidance suggests that in screening procedures, the annualized average concentration of an air pollutant to be estimated by multiplying the single-hour concentration by 10%.[39] According to the HRA Report, the closest residential receptors are located 25 feet west of the Project site (Appendix C-2, p. 1). However, review of the AERSCREEN output files demonstrates that the *maximally* exposed receptor is located approximately 125 meters from the Project site. Thus, for Project operation, the single-hour concentration at the MEIR estimated by AERSCREEN is approximately 1.937µg/m^3 DPM at approximately 125 meters downwind. Multiplying this single-hour concentration by 10%, we get an annualized average concentration of 0.1937 µg/m^3 for Project operation at the MEIR.

We calculated the excess cancer risk to the MEIR using applicable HRA methodologies prescribed by OEHHA. Consistent with the construction period of 1,034 days inputted into the DEIR's CalEEMod model, the annualized average concentration for Project operation was used for the remaining 13.42 years of the child stage of life (2 - 16 years) and the entire adult stage of life (16 – 30 years).

Consistent with the HRA Report's methodology, we used Age Sensitivity Factors ("ASFs") to account for the heightened susceptibility of young children to the carcinogenic toxicity of air pollution (Appendix C-2, p. 7). When applying ASFs, the quantified cancer risk should be multiplied by a factor of ten during the third trimester of pregnancy and during the first two years of life (infant), as well as multiplied by a factor of three during the child stage of life (2 – 16 years). Furthermore, in accordance with the guidance set forth by OEHHA, we used the 95th percentile breathing rates for infants.[40] Finally, according to SCAQMD guidance, we used a Fraction of Time At Home ("FAH") Value of 1 for the 3rd trimester and

[39] U.S. EPA (October 1992) Screening Procedures for Estimating the Air Quality Impact of Stationary Sources Revised, http://www.epa.gov/ttn/scram/guidance/guide/EPA-454R-92-019_OCR.pdf.

[40] "Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics 'Hot Spots' Information and Assessment Act," July 2018, *available at:* http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab2588supplementalguidelines.pdf, p. 16.
"Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf

infant receptors.[41] We used a cancer potency factor of 1.1 (mg/kg-day)$^{-1}$ and an averaging time of 25,550 days. The results of our calculations are shown below.

The Maximum Exposed Individual at an Existing Residential Receptor (MEIR)

Activity	Duration (years)	Concentration (ug/m3)	Breathing Rate (L/kg-day)	ASF	Cancer Risk with ASFs*
Total Construction	**2.83**				**4.2E-06**
Operation	13.42	0.1937	572	3	6.7E-05
Child Exposure Duration	***13.42***			***Child Exposure***	***6.7E-05***
Operation	14.00	0.1937	261	1	7.8E-06
Adult Exposure Duration	***14.00***			***Adult Exposure***	***7.8E-06***
Lifetime Exposure Duration	**30.25**			**Lifetime Exposure**	**7.9E-05**

As demonstrated in the table above, the excess cancer risk to adults and children at the MEIR located approximately 125 meters away, over the course of Project operation, utilizing ASFs, are approximately 7.8 and 67 in one million, respectively. When summing the Project's estimated operational cancer risks, as estimated by SWAPE, with the DEIR's purported construction-related cancer risk of 4.23 in one million, we estimate a lifetime excess cancer risk of approximately 79 in one million (p. 18). Thus, the child and lifetime cancer risks exceed the SCAQMD threshold of 10 in one million, resulting in a potentially significant impact not previously addressed or identified by the DEIR.

An agency must include an analysis of health risks that connects the Project's air emissions with the health risk posed by those emissions. Our analysis represents a screening-level HRA, which is known to be conservative and tends to err on the side of health protection. The purpose of the screening-level construction and operational HRA shown above is to demonstrate the link between the proposed Project's emissions and the potential health risk. Our screening-level HRA demonstrates that construction and operation of the Project could result in a potentially significant health risk impact, when correct exposure assumptions and up-to-date, applicable guidance are used. Therefore, since our screening-level construction HRA indicates a potentially significant impact, an updated EIR should include a reasonable effort to connect the Project's air quality emissions and the potential health risks posed to nearby receptors. Thus, an updated EIR should include a quantified air pollution model as well as an updated, quantified refined health risk assessment which adequately and accurately evaluates health risk impacts associated with both Project construction and operation.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Emissions

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 2,920.96 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year"), which would not exceed the SCAQMD bright-line threshold of 3,000 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4).

Table 4.6-4. Estimated Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Area	4.45	<0.01[a]	0.00	4.56
Energy (natural gas and electricity)	951.51	0.03	0.01	955.38
Mobile	1,764.82	0.08	0.00	1,766.93
Solid waste	17.53	1.04	0.00	43.42
Water supply and wastewater	80.60	0.02	0.01	84.77
Construction (amortized over 30 years)	—	—	—	65.90
			Total Emissions	2,920.96
			SCAQMD GHG Threshold	3,000
			Exceeds thresholds?	No

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrogen dioxide; CO_2e = carbon dioxide equivalent.
See Appendix C-1 for complete results.
Proposed Project GHG emissions are based on the "mitigated" CalEEMod outputs, which includes reduction in indoor and outdoor water consumption, consistent with CALGreen and compliance with the AB 939 waste reduction goal.
[a] <0.01 = value less than reported 0.01 metric tons per year.

Furthermore, the DEIR relies upon the Project's consistency with the City of El Segundo Climate Action Plan ("CAP"), SCAG's 2020-2045 *RTP/SCS*, CALGreen, CARB's *Scoping Plan*, and the General Plan's Air Quality Element, as well as EO S-3-05 and SB 32, in order to conclude that the Project would result in a less-than-significant GHG impact (p. 4.6-29 - 4.6-48). However, the DEIR's GHG analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons.

2-14 Cont.

(1) The DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
(2) The DEIR's quantitative GHG analysis relies upon an outdated threshold;
(3) The DEIR's unsubstantiated air model indicates a potentially significant impact;
(4) The DEIR fails to consider the performance-based standards under CARB's *Scoping Plan*; and
(5) The DEIR fails to consider the performance-based standards under SCAG's *RTP/SCS*.

1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 2,920.96 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the CalEEMod Outputs, provided as Appendix C-1 to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

20

2) Incorrect Reliance on an Outdated Quantitative GHG Threshold

As previously discussed, the DEIR estimates that the Project would generate net annual GHG emissions 2,920.96 MT CO_2e/year, which would not exceed the SCAQMD bright-line threshold of 3,000 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4). However, the guidance that provided the 3,000 MTCO_2/year threshold, the SCAQMD's 2008 *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules, and Plans* report, was developed when the Global Warming Solutions Act of 2006, commonly known as "AB 32", was the governing statute for GHG reductions in California. AB 32 requires California to reduce GHG emissions to 1990 levels by 2020.[42] As it is already April 2021, thresholds for 2020 are not applicable to the proposed Project. As such, the SCAQMD bright-line threshold of 3,000 MT CO_2e/year is outdated and inapplicable to the proposed Project, and the DEIR's less-than-significant GHG impact conclusion should not be relied upon.

Instead, we recommend that the Project apply the widely-used 2030 "Substantial Progress" threshold of 660 MT CO_2e/year[43] and AEP's "2030 Land Use Efficiency Threshold" of 2.6 metric tons of CO_2 equivalents per service population per year ("MT CO_2e/SP/year").[44] In support of thresholds for projects with a horizon year beyond 2020, AEP's guidance *states:*

> "Once the state has a full plan for 2030 (which is expected in 2017), and then *a project with a horizon between 2021 and 2030 should be evaluated based on a threshold using the 2030 target*. A more conservative approach would be to apply a 2030 threshold *based on SB 32* for any project with a horizon between 2021 and 2030 regardless of the status of the Scoping Plan Update" (emphasis added).[45]

As the California Air Resources Board ("CARB") adopted *California's 2017 Climate Change Scoping Plan* in November of 2017, the proposed Project "should be evaluated based on a threshold using the 2030 target," according to the relevant guidance referenced above. We recommend the preparation of an updated EIR to compare the Project's estimated GHG emissions, as estimated in an updated air model,

to the widely-used 2030 "Substantial Progress" threshold of 660 MT CO_2e/year[46] and AEP's "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e/SP/year.

3) Failure to Identify a Potentially Significant GHG Impact

When applying the widely-used 2030 "Substantial Progress" threshold of 660 MT CO_2e/year[47] and AEP "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e/SP/year,[48] the DEIR's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.[49] As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 2,920.96 MT CO_2e/year (p. 4.6-28 – 4.6-29, Table 4.6-4). Furthermore, according to CAPCOA's *CEQA & Climate Change* report, service population is defined as "the sum of the number of residents and the number of jobs supported by the project."[50] The DEIR estimates that the Project would house and employ approximately 618 residents and 56 employees, respectively, resulting in a service population of 674 people (p. IV.G-17, Table IV.G-4; IV.G-19, Table IV.G-5).[51] When dividing the Project's GHG emissions, as estimated by the DEIR, by a service population of 674 people, we find that the Project would emit approximately 4.3 MT CO_2e/SP/year (see table below).[52]

[50] CAPCOA (Jan. 2008) CEQA & Climate Change, p. 71-72, http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA-White-Paper.pdf.

[51] Calculated: 618 residents + 56 employees = 674 service population.

[52] Calculated: (2,920.96 MT CO_2e/year) / (674 service population) = (4.3 MT CO_2e/SP/year).

22

DEIR Modeling Greenhouse Gas Emissions	
Project Phase	**Proposed Project (MT CO_2e/year)**
Net Annual GHG Emissions	**2,921**
Threshold	660
Exceed?	***Yes***
Service Population	674
Service Population Efficiency	**4.3**
Threshold	2.6
Exceed?	***Yes***

As demonstrated above, the Project's net annual GHG emissions and service population efficiency, as estimated by the DEIR, exceed the 2030 "Substantial Progress" threshold of 660 MT CO_2e/SP/year and AEP's "2030 Land Use Efficiency Threshold" of 2.6 MT CO_2e/SP/year, respectively. As a result, the DEIR's less-than-significant GHG impact conclusion should not be relied upon. An updated EIR should be prepared for the Project and mitigation measures should be implemented to reduce the Project's GHG emissions to less-than-significant levels.

4) Failure to Consider Performance-based Standards Under CARB's 2017 Scoping Plan

As previously discussed, the DEIR relies upon the Project's consistency with CARB's 2017 *Scoping Plan* to determine Project GHG significance (p. 4.6-41 – 4.6-45). However, this is incorrect, as the DEIR fails to consider performance-based measures proposed by CARB.

2-14 Cont.

i. Passenger & Light Duty VMT Per Capita Benchmarks per SB 375

In reaching the State's long-term GHG emission reduction goals, CARB's 2017 *Scoping Plan* explicitly cites to SB 375 and the VMT reductions anticipated under the implementation of Sustainable Community Strategies.[53] CARB has identified the population and daily VMT from passenger autos and light-duty vehicles at the state and county level for each year between 2010 to 2050 under a "baseline scenario" that includes "current projections of VMT included in the existing Regional Transportation Plans/Sustainable Communities Strategies (RTP/SCSs) adopted by the State's 18 Metropolitan Planning Organizations (MPOs) pursuant to SB 375 as of 2015."[54] By dividing the projected daily VMT by the population, we calculated the daily VMT per capita for each year at the state and county level for 2010 (baseline year), 2025 (Project operational year), and 2030 (target years under SB 32) (see table below and Attachment B).

[53] "California's 2017 Climate Change Scoping Plan." CARB, November 2017, *available at*: https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, p. 25, 98, 101-103.
[54] "Supporting Calculations for 2017 Scoping Plan-Identified VMT Reductions," Excel Sheet "Readme." CARB, January 2019, *available at*: https://ww2.arb.ca.gov/sites/default/files/2019-01/sp_mss_vmt_calculations_jan19_0.xlsx.

2017 Scoping Plan Daily VMT Per Capita						
	Los Angeles County			State		
Year	Population	LDV VMT Baseline	VMT Per Capita	Population	LDV VMT Baseline	VMT Per Capita
2010	9,838,771	216,979,221.64	22.05	37,335,085	836,463,980.46	22.40
2025	10,671,800	217,340,094.90	20.37	42,326,397	929,443,512.65	21.96
2030	10,868,614	215,539,586.12	19.83	43,939,250	957,178,153.19	21.78

The below table compares the 2017 *Scoping Plan* daily VMT per capita values against the daily VMT per capita values for the Project based on SWAPE's updated modeling (see table below and Attachment B).

Daily VMT Per Capita from Passenger & Light-Duty Trucks, Exceedances under 2017 Scoping Plan Performance-Based SB 375 Benchmarks	
Sources	Project
	SWAPE Modeling
Annual VMT from Auto & Light-Duty Vehicles	5,937,594
Daily VMT from Auto & Light-Duty Vehicles	16,267
Service Population	674
Daily VMT Per Capita	24.14
2017 Scoping Plan Benchmarks, Statewide	
22.40 VMT (2010 Baseline) Exceed?	Yes
21.96 VMT (2025 Projected) Exceed?	Yes
21.78 VMT (2030 Projected) Exceed?	Yes
2017 Scoping Plan Benchmarks, Los Angeles County Specific	
22.05 VMT (2010 Baseline) Exceed?	Yes
20.37 VMT (2025 Projected) Exceed?	Yes
19.83 VMT (2030 Projected) Exceed?	Yes

As shown above, SWAPE's updated modeling shows that the Project exceeds the CARB 2017 *Scoping Plan* projections for 2010, 2025, and 2030. Because the exceeds the CARB 2017 *Scoping Plan* performance-based daily VMT per capita projections, the Project conflicts with the CARB 2017 *Scoping Plan* and SB 375. As such, the DEIR's claim that the proposed Project would not conflict with the CARB 2017 *Scoping Plan* is unsupported. Project-specific EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

5) Failure to Consider Performance-based Standards under SCAG's RTP/SCS

Here, as discussed above, the DEIR concludes that the Project would be consistent with SCAG's *RTP/SCS* (p. 4.6-34 – 4.6-37). However, the DEIR fails to consider whether or not the Project meets any of the specific performance-based goals underlying SCAG's *RTP/SCS* and SB 375, such as: i) per capita GHG emission targets, or ii) daily vehicles miles traveled ("VMT") per capita benchmarks.

24

2-14 Cont.

i. SB 375 Per Capita GHG Emission Goals

SB 375 was signed into law in September 2008 to enhance the state's ability to reach AB 32 goals by directing CARB to develop regional 2020 and 2035 GHG emission reduction targets for passenger vehicles (autos and light-duty trucks). In March 2018, CARB adopted updated regional targets requiring a 19 percent decrease in VMT for the SCAG region by 2035. This goal is reflected in SCAG's 2020 RTP/SCS Program Environmental Impact Report ("PEIR"),[55] in which the 2020 RTP/SCS PEIR updates the per capita emissions to 18.8 lbs/day in 2035 (*see* excerpt below).[56]

Table 3.8-10
SB 375 Analysis

	2005 (Baseline)	2020 (Plan)	2035 (Plan)
Resident population (per 1,000)	17,161	19,194	21,110
CO2 emissions (per 1,000 tons)	204.0/a/	204.5/a/	198.6/b/
Per capita emissions (pounds/day)	23.8	21.3	18.8
% difference from Plan (2020) to Baseline (2005)			–8%
% difference from Plan (2035) to Baseline (2005)			–19%

Note:

2-14 Cont.

In order to evaluate consistency with this SB 375 objective and SCAG's *RTP/SCS* performance-based goal, SWAPE calculated the Project's per-capita CO_2 emissions from passenger and light duty vehicles (calculations attached hereto as Attachment B). First, total annual GHG mobile emissions were multiplied by the percentage of auto and light-duty truck fleet mix, then converted into total pounds per day, then divided by the estimated service population of 674. The below table shows the per capita emissions for the Project based on SWAPE's updated modeling (see table below and Attachment B).

[55] "Connect SoCal Certified Final Program Environmental Impact Report." SCAG, May 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_complete.pdf?1607981618.
[56] "Connect SoCal Certified Final Program Environmental Impact Report." SCAG, May 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_complete.pdf?1607981618, p. 3.8-74.

CO_2e Per Capita Emissions from Passenger & Light-Duty Trucks, Exceedances under RTP/SCS Performance-Based SB 375 Goals	
Sources	**Project**
	SWAPE Modeling
Annual Mobile Emissions (MT CO_2e/year)	2,553.25
Passenger & Light-Duty Fleet Mix (%)	91.23%
Daily CO_2e Emissions (lbs/day)	14,068.52
Service Population	674
Per Capita Emissions (lbs/day)	**20.87**
18.8 lbs/day/SP (2045 Target) Exceeded?	Yes

As shown in the above table, when utilizing the DEIR's modeling, the Project would result in 20.87 pounds per day per service population ("lbs/day/SP") emissions. This exceeds SCAG's 2035 target of 18.8-lbs/day/SP, indicating that the Project is inconsistent with SB 375 and SCAG's *RTP/SCS*.

i. SB 375 RTP/SCS Daily VMT Per Capita Target

Under the SCAG's 2020 *RTP/SCS*, daily VMT per capita in the SCAG region should decrease from 23.2 VMT in 2016 to 20.7 VMT by 2045.[57] Daily VMT per capita in Los Angeles County should decrease from 22.2 to 19.2 VMT during that same period.[58]

Here, however, the DEIR fails to consider any of the above-mentioned performance-based VMT targets. In order to evaluate consistency with the *RTP/SCS*'s performance-based VMT reduction targets, SWAPE calculated the Project's VMT from passenger and light duty vehicles (calculations attached hereto as Attachment B). First, annual VMTs from passenger automobile and light-duty vehicle were calculated based on the CalEEMod default fleet mix, converted into daily VMT, and divided by the estimated service population of 674. The below table shows the daily VMT per capita for the Project based on SWAPE's updated modeling (see table below and Attachment B).

2020 RTP/SCS Benchmarks, SCAG-Wide	
23.2 VMT (2016 Baseline) Exceed?	Yes
20.7 VMT (2045 Target) Exceed?	Yes
2020 RTP/SCS Benchmarks, Los Angeles County	
22.2 VMT (2016 Baseline) Exceed?	Yes
19.2 VMT (2045 Target) Exceed?	Yes

As shown in the above table, based on a service population of 674, the Project would result in 24.14 VMT per capita from passenger auto and light-duty truck vehicles. This exceeds all SCAG-wide and Los Angeles County-specific benchmarks and targets under SCAG's 2020 *RTP/SCS*. Thus, based on SWAPE's updated modeling, the Project would exceed the 2016 baseline and 2045 target VMT per capita values for both Los Angeles County and the SCAG region as a whole, indicating that the Project conflicts with the SCAG's *RTP/SCS* and SB 375.

2-14 Cont.

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in potentially significant health risk and GHG impacts that should be mitigated further. In an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Feasible mitigation measures can be found in CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures*.[59] Therefore, to reduce the Project's emissions, consideration of the following measures should be made:

CAPCOA's Quantifying Greenhouse Gas Mitigation Measures[60]
Measures – Energy
Building Energy Use
Install Programmable Thermostat Timers
Obtain Third-party HVAC Commissioning and Verification of Energy Savings

[59] http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf
[60] "Quantifying Greenhouse Gas Mitigation Measures." California Air Pollution Control Officers Association (CAPCOA), August 2010, *available at:* http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf, p.

Install Energy Efficient Appliances
Install Energy Efficient Boilers
Lighting
Install Higher Efficacy Public Street and Area Lighting
Limit Outdoor Lighting Requirements
Replace Traffic Lights with LED Traffic Lights
Alternative Energy Generation
Establish Onsite Renewable or Carbon-Neutral Energy Systems
Establish Onsite Renewable Energy System – Solar Power
Utilize a Combined Heat and Power System
Measures – Transportation
Land Use/Location
Increase Density
Increase Destination Accessibility
Integrate Affordable and Below Market Rate Housing
Neighborhood/Site Enhancements
Provide Pedestrian Network Improvements, such as: • Compact, mixed-use communities • Interconnected street network • Narrower roadways and shorter block lengths • Sidewalks • Accessibility to transit and transit shelters • Traffic calming measures and street trees • Parks and public spaces • Minimize pedestrian barriers
Provide Traffic Calming Measures, such as: • Marked crosswalks • Count-down signal timers • Curb extensions • Speed tables • Raised crosswalks • Raised intersections • Median islands • Tight corner radii • Roundabouts or mini-circles • On-street parking • Planter strips with trees • Chicanes/chokers
Implement a Neighborhood Electric Vehicle (NEV) Network.
Create Urban Non-Motorized Zones

28

2-14 Cont.

Dedicate Land for Bike Trails
Parking Policy/Pricing
Limit Parking Supply through: • Elimination (or reduction) of minimum parking requirements • Creation of maximum parking requirements • Provision of shared parking
Unbundle Parking Costs from Property Cost
Implement Market Price Public Parking (On-Street)
Require Residential Area Parking Permits
Commute Trip Reduction Programs
Implement Commute Trip Reduction (CTR) Program – Voluntary • Carpooling encouragement • Ride-matching assistance • Preferential carpool parking • Flexible work schedules for carpools • Half time transportation coordinator • Vanpool assistance • Bicycle end-trip facilities (parking, showers and lockers) • New employee orientation of trip reduction and alternative mode options • Event promotions and publications • Flexible work schedule for employees • Transit subsidies • Parking cash-out or priced parking • Shuttles • Emergency ride home
Implement Commute Trip Reduction (CTR) Program – Required Implementation/Monitoring • Established performance standards (e.g. trip reduction requirements) • Required implementation • Regular monitoring and reporting
Provide Ride-Sharing Programs • Designate a certain percentage of parking spaces for ride sharing vehicles • Designating adequate passenger loading and unloading and waiting areas for ride-sharing vehicles • Providing a web site or messaging board for coordinating rides • Permanent transportation management association membership and funding requirement.
Implement Subsidized or Discounted Transit Program
Provide End of Trip Facilities, including: • Showers • Secure bicycle lockers • Changing spaces
Encourage Telecommuting and Alternative Work Schedules, such as: • Staggered starting times • Flexible schedules

2-14 Cont.

29

• Compressed work weeks
Implement Commute Trip Reduction Marketing, such as: • New employee orientation of trip reduction and alternative mode options • Event promotions • Publications
Implement Preferential Parking Permit Program
Implement Car-Sharing Program
Provide Employer-Sponsored Vanpool/Shuttle
Implement Bike-Sharing Programs
Price Workplace Parking, such as: • Explicitly charging for parking for its employees; • Implementing above market rate pricing; • Validating parking only for invited guests; • Not providing employee parking and transportation allowances; and • Educating employees about available alternatives.
Implement Employee Parking "Cash-Out"
Transit System Improvements
Transit System Improvements, including: • Grade-separated right-of-way, including bus only lanes (for buses, emergency vehicles, and sometimes taxis), and other Transit Priority measures. Some systems use guideways which automatically steer the bus on portions of the route. • Frequent, high-capacity service • High-quality vehicles that are easy to board, quiet, clean, and comfortable to ride. • Pre-paid fare collection to minimize boarding delays. • Integrated fare systems, allowing free or discounted transfers between routes and modes. • Convenient user information and marketing programs. • High quality bus stations with Transit Oriented Development in nearby areas. • Modal integration, with BRT service coordinated with walking and cycling facilities, taxi services, intercity bus, rail transit, and other transportation services.
Implement Transit Access Improvements, such as: • Sidewalk/crosswalk safety enhancements • Bus shelter improvements
Expand Transit Network
Increase Transit Service Frequency/Speed
Provide Local Shuttles
Road Pricing/Management
Implement Area or Cordon Pricing
Improve Traffic Flow, such as: • Signalization improvements to reduce delay; • Incident management to increase response time to breakdowns and collisions;

2-14 Cont.

30

• Intelligent Transportation Systems (ITS) to provide real-time information regarding road conditions and directions; and • Speed management to reduce high free-flow speeds.
Required Project Contributions to Transportation Infrastructure Improvement Projects
Install Park-and-Ride Lots
Vehicles
Utilize Alternative Fueled Vehicles, such as: • Biodiesel (B20) • Liquefied Natural Gas (LNG) • Compressed Natural Gas (CNG)
Utilize Electric or Hybrid Vehicles
Measures – Water
Water Supply
Use Reclaimed Water
Use Gray Water
Use Locally Sourced Water Supply
Water Use
Install Low-Flow Water Fixtures
Adopt a Water Conservation strategy
Design Water-Efficient Landscapes (see California Department of Water Resources Model Water Efficient Landscape Ordinance), such as: • Reducing lawn sizes; • Planting vegetation with minimal water needs, such as native species; • Choosing vegetation appropriate for the climate of the project site; • Choosing complimentary plants with similar water needs or which can provide each other with shade and/or water.
Use Water-Efficient Landscape Irrigation Systems ("Smart" irrigation control systems)
Reduce Turf in Landscapes and Lawns
Measures – Area Landscaping
Landscaping Equipment
Prohibit Gas Powered Landscape Equipment
Electric Yard Equipment Compatibility
Measures – Solid Waste
Solid Waste
Recycle Demolished Construction Material
Measures – Vegetation
Vegetation
Urban Tree Planting

2-14 Cont.

31

Create New Vegetated Open Space
Measures – Construction
Construction
Use Alternative Fuels for Construction Equipment
Urban Tree Planting
Use Electric and Hybrid Construction Equipment
Limit Construction Equipment Idling Beyond Regulation Requirements
Institute a Heavy-Duty Off-Road Vehicle Plan, including: • Construction vehicle inventory tracking system; • Requiring hour meters on equipment; • Document the serial number, horsepower, manufacture age, fuel, etc. of all onsite equipment; and • Daily logging of the operating hours of the equipment.
Implement a Construction Vehicle Inventory Tracking System
Measures – Miscellaneous
Miscellaneous
Establish a Carbon Sequestration Project, such as: • Geologic sequestration or carbon capture and storage techniques, in which CO_2 from point sources is captured and injected underground; • Terrestrial sequestration in which ecosystems are established or preserved to serve as CO_2 sinks; • Novel techniques involving advanced chemical or biological pathways; or • Technologies yet to be discovered.
Establish Off-Site Mitigation
Use Local and Sustainable Building Materials
Require Environmentally Responsible Purchasing, such as: • Purchasing products with sustainable packaging; • Purchasing post-consumer recycled copier paper, paper towels, and stationary; • Purchasing and stocking communal kitchens with reusable dishes and utensils; • Choosing sustainable cleaning supplies; • Leasing equipment from manufacturers who will recycle the components at their end of life; • Choosing ENERGY STAR appliances and Water Sense-certified water fixtures; • Choosing electronic appliances with built in sleep-mode timers; • Purchasing 'green power' (e.g. electricity generated from renewable or hydropower) from the utility; and • Choosing locally-made and distributed products.

2-14 Cont.

Furthermore, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project from NEDC's *Diesel Emission Controls in Construction*

32

Projects.[61] Therefore, to reduce the Project's emissions, consideration of the following measures should be made:

NEDC's *Diesel Emission Controls in Construction Projects*[62]
Measures – Diesel Emission Control Technology
a. Diesel Onroad Vehicles All diesel nonroad vehicles on site for more than 10 total days must have either (1) engines that meet EPA onroad emissions standards or (2) emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%.
b. Diesel Generators All diesel generators on site for more than 10 total days must be equipped with emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%.
c. Emission control technology shall be operated, maintained, and serviced as recommended by the emission control technology manufacturer.
Measures – Additional Diesel Requirements
a. Construction shall not proceed until the contractor submits a certified list of all diesel vehicles, construction equipment, and generators to be used on site. The list shall include the following: i. Contractor and subcontractor name and address, plus contact person responsible for the vehicles or equipment. ii. Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. iii. For the emission control technology installed: technology type, serial number, make, model, manufacturer, EPA/CARB verification number/level, and installation date and hour-meter reading on installation date.
b. If the contractor subsequently needs to bring on site equipment not on the list, the contractor shall submit written notification within 24 hours that attests the equipment complies with all contract conditions and provide information.
c. All diesel equipment shall comply with all pertinent local, state, and federal regulations relative to exhaust emission controls and safety.
d. The contractor shall establish generator sites and truck-staging zones for vehicles waiting to load or unload material on site. Such zones shall be located where diesel emissions have the least impact on abutters, the general public, and especially sensitive receptors such as hospitals, schools, daycare facilities, elderly housing, and convalescent facilities.
Reporting
a. For each onroad diesel vehicle, nonroad construction equipment, or generator, the contractor shall submit to the developer's representative a report prior to bringing said equipment on site that includes: i. Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, and engine serial number.

[62] "Diesel Emission Controls in Construction Projects." Northeast Diesel Collaborative (NEDC), December 2010, *available at:* https://www.epa.gov/sites/production/files/2015-09/documents/nedc-model-contract-sepcification.pdf.

33

ii.	The type of emission control technology installed, serial number, make, model, manufacturer, and EPA/CARB verification number/level.
iii.	The Certification Statement signed and printed on the contractor's letterhead.
b.	The contractor shall submit to the developer's representative a monthly report that, for each onroad diesel vehicle, nonroad construction equipment, or generator onsite, includes:
i.	Hour-meter readings on arrival on-site, the first and last day of every month, and on off-site date.
ii.	Any problems with the equipment or emission controls.
iii.	Certified copies of fuel deliveries for the time period that identify:
1.	Source of supply
2.	Quantity of fuel
3.	Quality of fuel, including sulfur content (percent by weight)

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include an updated health risk and GHG analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding underestimated land use sizes.

Construction Phase - Consistent with the DEIR's model.

Trips and VMT - See SWAPE comment regarding hauling trips. Worker and vendor trips consistent with the DEIR's model.

On-road Fugitive Dust -

Demolition - See SWAPE comment regarding demolition.

Grading - See SWAPE comment regarding acres of grading values, material mositure content, and material silt content. Material export consistent with the DEIR's model.

Architectural Coating - Architectural coating EFs consistent with the DEIR's model. See SWAPE comment regarding architectural coating areas.

Vehicle Trips - See SWAPE comment regarding operational vehicle trip rates.

Woodstoves - Consistent with the DEIR's model.

Area Coating - See SWAPE comment regarding area coating areas.

Energy Use -

Water And Wastewater - See SWAPE comment regarding wastewater treatment percentages.

Construction Off-road Equipment Mitigation - See SWAPE comment regarding construction-related mitigation measures.

Mobile Land Use Mitigation - See SWAPE comment regarding operational mitigation measures.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	792.00	Space	0.00	219,900.00	0
Other Asphalt Surfaces	12.89	1000sqft	0.00	12,650.00	0
High Turnover (Sit Down Restaurant)	4.95	1000sqft	0.00	3,952.00	0
Apartments Mid Rise	283.00	Dwelling Unit	0.00	327,021.00	752
Regional Shopping Center	7.30	1000sqft	5.35	7,300.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	9			**Operational Year**	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	561.77	**CH4 Intensity (lb/MWhr)**	0.02	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding underestimated land use sizes.

Construction Phase - Consistent with the DEIR's model.

Trips and VMT - See SWAPE comment regarding hauling trips. Worker and vendor trips consistent with the DEIR's model.

On-road Fugitive Dust -

Demolition - See SWAPE comment regarding demolition.

Grading - See SWAPE comment regarding acres of grading values, material mositure content, and material silt content. Material export consistent with the DEIR's model.

Architectural Coating - Architectural coating EFs consistent with the DEIR's model. See SWAPE comment regarding architectural coating areas.

Vehicle Trips - See SWAPE comment regarding operational vehicle trip rates.

Woodstoves - Consistent with the DEIR's model.

Area Coating - See SWAPE comment regarding area coating areas.

Energy Use -

Water And Wastewater - See SWAPE comment regarding wastewater treatment percentages.

Construction Off-road Equipment Mitigation - See SWAPE comment regarding construction-related mitigation measures.

Mobile Land Use Mitigation - See SWAPE comment regarding operational mitigation measures.

SWAPE Technical Consultation, Data Analysis and Litigation Support for the Environment

SOIL WATER AIR PROTECTION ENTERPRISE
2656 29th Street, Suite 201
Santa Monica, California 90405
Attn: Paul Rosenfeld, Ph.D.
Mobil: (310) 795-2335
Office: (310) 452-5555
Fax: (310) 452-5550
Email: prosenfeld@swape.com

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

2-15

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association, Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

SWAPE Technical Consultation, Data Analysis and Litigation Support for the Environment

2656 29th Street, Suite 201
Santa Monica, CA 90405

Matt Hagemann, P.G, C.Hg.
(949) 887-9013
mhagemann@swape.com

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:
M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:
California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:
Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

2-15 Cont.

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 150 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

2

2-15 Cont.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

2-15 Cont.

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

4

2-15 Cont.

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

INTENTIONALLY LEFT BLANK

Response to Comment Letter 2

Supporters Alliance for Environmental Responsibility
("SAFER", via Lozeau Drury LLP)
December 9, 2021

2-1 In summary, this comment includes an introductory statement for the comment letter and asserts the Final EIR does not adequately inform about or analyze environmental impacts, and does not impose feasible mitigation measures to reduce impacts. Additionally, the comment notes further comments within Comment Letter 2 were prepared with the assistance of Francis "Bud" Offermann, P.E., CIH (included as Comments 2-9 and 2-10). Please see Response to Comments 2-9 and 2-10 for more discussion. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

2-2 In summary, this comment correctly summarizes the Project Description for the proposed Project. However, the comment states the site is bound by Los Angeles International Airport (LAX) to the north. For informational purposes, LAX is not located immediately adjacent to the Project site, but instead 0.5-mile to the north. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

2-3 In summary, this comment cites various excerpts of case law and related to CEQA's legislative intent to inform decision makers and the public and avoid and reduce environmental impacts or adopt a statement of overriding considerations. The EIR for the proposed Project was prepared in compliance with CEQA and the CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 *et seq*. The comment does not raise any specific concerns related to the adequacy of the environmental analysis in the EIR; therefore, no further response to this comment is required.

2-4 In summary, this comment states that the Project would expose residents and commercial employees of the Project to significant impacts related to indoor air quality, and in particular, emissions of the cancer-causing chemical formaldehyde.

Workers are not considered sensitive receptors under CEQA but are covered by the standards and protocols of the Occupational Health and Safety Administration (OSHA). Discussion of impacts on indoor air quality on future occupants of new construction is not specified or required by the City's CEQA Guidelines, State CEQA Guidelines, or California's air district guidelines. California air districts base their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the state and federal ambient air quality standards (AAQS). The AAQS is based on maximum pollutant levels in outdoor air that would not harm the public's health. Furthermore, the commenter speculates on indoor air quality associated with finishes used on building material and furniture. Indoor air quality does not rise to the level of substantial evidence because it is generalized and does not address the specific impacts of this Project. Building materials are required to reduce exposure to toxic substances through compliance with the U.S. Environmental Protection Agency and the California Air Resources Board regulations, such as 40 CFR Part 770, Formaldehyde Emission Standards for Composite Wood Products. The regulations typically apply to manufacturers, distributors, importers, fabricators, and retailers of the products. All building materials used for the project would be required to comply with the applicable federal and state standards.

The Project (both nonresidential and residential uses) will need to comply with the 2019 CALGreen Code, which specifies that composite wood products (such as hardwood plywood and particleboard) meet the requirements for formaldehyde as specified in the California Air Resources Board's Air Toxic Control Measures. The 2019 CALGreen building code also does not allow added formaldehyde-based resins or ultra-low emitting formaldehyde resins, and requires documentation of compliance with the California Air Resources Board's Air Toxic Control Measures. (See Section 5.504.4.5, Chapter 5, Part 11, 2019 California Green Building Standards Code, July 2019, incorporated herein by this reference.) Furthermore, the 2019 Title 24 standards increased the level of air filtration required for new residential construction, from minimum efficiency reporting value (MERV) 6 to MERV 13, per American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), with the stated goal of reducing indoor PM2.5 concentrations. To accommodate the higher efficiency filter requirements, the proposed changes would also require that return grilles be able to accommodate at least a 2-inch deep filter to ensure that MERV 13 filters can be installed with minimal impact on HVAC system performance. MERV 13 filters remove at least 90% of particles sized 3.0 and 10.0 microns, 85% of particles sized 1.0 to 3.0 microns, and 50% of particles sized 0.3 to 1.0 microns, which would minimize the potential for new residents to be exposed to substantial TAC and PM2.5 emissions. The commenter is speculating in the assertion that composite wood materials would be used in the interior of the building. Indoor building materials will not be known until the building permit stage, and as stated above, these materials will be required to comply with the California Air Resources Board and 2019 CALGreen building code.

The commenter's conclusions were not based on the assumption that the Project would be built in accordance with CARB's Air Toxic Control Measures and 2019 CALGreen building code. The commenter provides no evidence to substantiate a contrary conclusion that in spite of the proposed Project using materials that comply with the standards of the CARB's Air Toxic Control Measures, the proposed Project would still expose occupants to toxic substances that results in exceeding the SCAQMD CEQA significance health risk threshold. No changes to the Draft EIR is required.

2-5 In summary, this comment states that the SWRCC included a memorandum which concluded that there is Substantial Evidence that the Project will have significant adverse air quality, health risk, and GHG impacts.

The SWRCC letter has been responded to in full in Response to Comment Letter 1 (see Responses to Comments 1-1 through 1-53) in this document. As discussed in these responses, all comments raised have been addressed and no new significant environmental impacts were raised that were not adequately addressed through the Draft EIR.

2-6 The commenter states that there is substantial evidence that the Project may have a significant health impact as a result of DPM.

The SWRCC letter included similar assertions regarding DPM-related health risk. See Comment Letter 1 (Response to Comment 1-42) in this document. As discussed in this response, the comment raised has been addressed and no new significant environmental impacts were raised that were not adequately addressed through the Draft EIR.

2-7 The commenter states that they believe that the impact conclusions contained in the Draft EIR are inadequate. Specifically, the commenter states that the Project would result in significant impacts based on 1) The Draft EIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air

model; 2) The Draft EIR's quantitative GHG analysis relies upon an outdated threshold; 3) The Draft EIR's unsubstantiated air model indicates a potentially significant impact; 4) The Draft EIR fails to consider the performance-based standards under CARB's Scoping Plan; and; 5) The Draft EIR fails to consider the performance-based standards under SCAG's RTP/SCS.

The SWRCC letter included similar assertions related to the Draft EIR's greenhouse gas emission analysis. See Comment Letter 1 (Response to Comment 1-43) in this document. As discussed in this response, the comment raised has been addressed and no new significant environmental impacts were raised that were not adequately addressed through the Draft EIR.

2-8 This comment notes the aforementioned comments (included as Comments 2-4 through 2-7) as reasons why the EIR is inadequate. Additionally, the comment expresses opposition to the proposed Project. The commenter's general opposition to the Project will be provided to the City's decision makers for their review and consideration.

2-9 The commenter states that the Project would expose residents and commercial employees of the Project to significant impacts related to indoor air quality, and in particular, emissions of the cancer-causing chemical formaldehyde.

Please see Response to Comment 2-4.

2-10 This comment includes the curriculum vitae of Francis "Bud" J. Offermann II, P.E., CIH. The comment does not express any environmental comments or concerns related to the environmental analysis in the Draft EIR. No response is required.

2-11 In summary, the comment states that the Draft EIR did not support its findings with substantial evidence.

This comment is a direct repeat of comments provided in Comment Letter 1 (see Responses to Comments 1-8 through 1-25). As discussed in the responses, the comments raised have been addressed and no new significant environmental impacts were raised that were not adequately addressed through the Draft EIR.

2-12 The commenter provides technical modeling to discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

This comment is interpreted to be a request that the City implement a "local hire" requirement on the proposed Project, citing benefits to greenhouse gas, air quality, and transportation impacts through decreased trip lengths. As stated in Draft EIR Sections 4.2, Air Quality, 4.6, Greenhouse Gas Emissions, and Section 4.13, Transportation, there are no significant short-term construction-related or long-term operational environmental impacts that are related to the length of vehicle trips or the proximity of workers to the Project site. CalEEMod was used to calculate the annual GHG emissions based on the construction scenario described in Section 4.6.3, Thresholds of Significance. Construction of the proposed Project is anticipated to commence in October 2021 and reach completion in July 2024, lasting a total of 34 months.[3] On-site sources of GHG emissions include off-road equipment and off-

[3] As explained in Section 4.2 of the Draft EIR, October 2021 represents the earliest possible start date. In practice, construction may begin at a later date. However, using an earlier start date for construction represents the worst-case scenario construction

site sources including haul trucks, vendor trucks, and worker vehicles. Overall, the Project was estimated to result in approximately 1,977 MT CO_2e per year and 66 MT CO_2e amortized over 30 years, consistent with SCAQMD guidance which states that construction emissions should be amortized over 30 years (SCAQMD 2008). Thus, the GHG analysis adds amortized construction emissions to the estimated annual operational emissions and then compares operational emissions to the proposed SCAQMD threshold of 3,000 MT CO_2e per year. As presented on Table 4.6-4 of the EIR, the Project's GHG emissions associated with development of the proposed Project would be 2,921 MT CO_2e, which is below the SCAQMD GHG threshold of 3,000 MT CO_2e per year. No changes to the Draft EIR are required and additional mitigation measures are not required to reduce GHG emissions. Therefore, there is no obligation under CEQA to consider implementation of skilled and trained workforce requirements, and no changes to the EIR are required.

2-13 This comment represents the curriculum vitae of Paul Rosenfeld, Ph.D., and Matt Hagemann, P.G., C.Hg. The comment does not express any environmental comments or concerns related to the environmental analysis in the Draft EIR. No response is required.

2-14 The commenter states that the input parameters of the air quality and GHG modeling are unsubstantiated.

This comment is a direct repeat of comments provided in Comment Letter 1 (see Responses to Comments 1-28 through 1-51). As discussed in the responses, the comments raised have been addressed and no new significant environmental impacts were raised that were not adequately addressed through the Draft EIR.

2-15 This comment represents the curriculum vitae of Paul Rosenfeld, Ph.D., and Matt Hagemann, P.G., C.Hg. The comment does not express any environmental comments or concerns related to the environmental analysis in the Draft EIR. No response is required.

impacts, because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles.

Verbal Comment 1

Verbal Comment 1

Nino Mascolo
Property Owner
December 9, 2021

The following represents a transcription of verbal comments provided at the December 9, 2021 Planning Commission meeting:

Water supply

The environmental impact report addresses and describes the capacity to provide water adequately however, does not address the topic of water quantity and water supply. There is a "will serve" letter from the utility, but that's all. There is analysis of the water supply. We have been in a drought for the last two years and the state is considering fines for those users not reducing their water consumption.

The environmental impact report did not address the drought. It did not address whether there will be incremental use increase or to what extent the project will use more water compared to the current water use under baseline conditions. Given the need to decrease water consumption statewide, that is a critical issue. This project increases water consumption, so the burden should fall on the developer not on the community to obtain additional water.

1-1

Parking

The environmental impact report appendices state that there will be a before and after parking study which is a good idea. But any impacts that occur because of the development impose a burden on the property owners, their guests, and the public to figure out what to do. The environmental impact report does not require the project developer to address any of those parking impacts. There is a suggestion that a parking permit program be implemented, but I don't know how practical it will be. I propose that the project's residents and employees be the ones required to obtain parking passes. They should be the ones ticketed for parking next to Washington Park, which is a popular destination, and not the existing residents in the neighborhood. It's not fair for property owners and their guests to be burdened. The staff report states that the project will have to meet less strict parking requirements. The project residents and users will not park in a parking structure (within the project area) that is far from their units. Instead, they will choose to park on the street which is more convenient.

1-2

Traffic

EIR Section 4.1 3.4 talks about intersections. It states that five intersections will remain at level E or worse with the project. The project should be mitigating those impacts. We should be asking the developer to make things a little better and not impose worse conditions on the neighbors. Appendix J says there will be 2,500 additional daily trips caused by the project but parking is not being addressed.

1-3

INTENTIONALLY LEFT BLANK

Response to Verbal Comment 1

Nino Mascolo
Individual
December 9, 2021

1-1 In summary, this comment states the Draft EIR does not adequately address water quality and water supply under drought conditions. Additionally, the comment expresses concern with the Project's water consumption.

The commenter was not specific in their concerns related to water quality. Please see Draft EIR Section 4.8, Hydrology and Water Quality, for discussion related to existing regulations and Project-specific analysis related to water quality standards.

In summary, this comment states the Draft EIR does not analyze Project impacts to water supply. As mentioned by the commenter, a Water Supply Will Serve Letter (included as Appendix G-2 of the Draft EIR) was referenced in the Draft EIR's analysis. Appendix G-2 was prepared by the City's Water Department to support the analysis contained within Section 4.15, Utilities and Service Systems, of the Draft EIR and represents assurance for the Project's anticipated water demands by providing and requiring potable water connections. In return, the City will charge the Project Applicant various fees for providing potable water and wastewater services to serve the proposed Project (Draft EIR page 4.15-21). Additionally, the Draft EIR summarizes applicable components and cites the City's Urban Water Management Plan (UWMP), which provides scenarios for anticipated water supply and demand, including availability to serve during normal, dry, and multiple dry years. As detailed further in Section 4.15, it was determined that the City would be able to meet the demand proposed by the Project and result in less than significant impacts (Draft EIR pages 4.15-19 through 4.15-22). No change or addition to the EIR's environmental analyses are required.

1-2 In summary, this comment states comments related to parking. The comment expresses support for Appendix J-2 of the Draft EIR's conclusion suggesting the following:

> "A before and after study could be conducted on the adjacent residential streets to understand if the project has an effect on street parking. Based on the results of the study and if desired by the City and the residents in the adjacent neighborhoods, a residential parking district could be implemented to deter non-residential users from parking on the street." (Appendix J-2 page 14)

Moreover, the comment correctly states impacts to parking are not within the scope of the environmental analysis as required by CEQA. Nevertheless, this suggestion to provide parking permits for residents and employees will be provided to City decision makers for their review and consideration.

Additionally, the commenter suggests the Project's future residents and users would not park in the proposed parking structure, stating the structure is too far from the proposed units. For clarification, each area within the Project site would provide parking spaces as shown in Table 3-2, Conceptual Site Plan and Specific Plan Buildout Summary, within Chapter 3, Project Description, of the Draft EIR. No change or addition to the EIR's environmental analyses are required.

1-3 This comment notes discussion within the Section 4.13, Transportation, of the Draft EIR which states five study intersections are projected to operate at a level of service (LOS) E or worse during AM or PM peak periods under Future Plus Project conditions (Draft EIR pages 4.13-19 and 4.13-20). Moreover, the comment suggests mitigation should be incorporated to reduce impacts.

As discussed in Draft EIR Section 4.13, Project improvements are planned for the eastbound lane of Mariposa Avenue at PCH (see Development Standard C.1 of the Specific Plan), which would be reconfigured as a part of the proposed Project, from one left lane and one through-right lane to one left, one through, and one right-turn lane. This infrastructure improvement has been taken into account for the plus-Project scenarios of the environmental analysis. The plus-Project scenarios of the impact analysis have also been analyzed without the Project improvement to show its potential benefit when compared to the baseline conditions (Draft EIR page 4.13-15). The analysis shows that LOS at Mariposa Avenue and PCH is better with the addition of the Project-related improvement than without. A queuing analysis was conducted for the eastbound approach with and without Project improvement to show the potential improvement in queue length. The results of this analysis are shown in Appendix E of the TIA (Appendix J-1 of the Draft EIR) (Draft EIR page 4.13-19).

However, the commenter's concern for traffic congestion is no longer considered an environmental topic of concern under CEQA (California Public Resources Code Section 21099(b)(2)). The Draft EIR includes information on intersection operations and congestion level of service (i.e., LOS) for informational purposes only. The analysis is included as it relates to the applicability of General Plan policies (see Draft EIR, Section 4.13 and Appendix J-1). Although, automobile delay and traffic congestion are not considered to be impacts on the environment, analysis was prepared related to the Project's consistency with Section 15064.3(b) of the State CEQA Guidelines. No change or addition to the EIR's environmental analyses are required.

Response to Verbal Comment 3

Ray Lawson
Southwest Regional Council of Carpenters
December 9, 2021

3-1 The commenter notes his representation with the Southwest Regional Carpenters union, and states hiring local members to work on the proposed Project would help reduce impacts to greenhouse gas emissions. The comment further details example benefits of the union. This comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. Nevertheless, the comment will be provided to City decision makers for their review and consideration.

Verbal Comment 4

Verbal Comment 4

Paul Morrison
421 Indiana Street
December 9, 2021

The following represents a transcription of verbal comments provided at the December 9, 2021 Planning Commission meeting:

I live across from the proposed parking structure. 4-1

Displacement of residents

Table ES 1 in the environmental impact report which contains a summary of impacts states that the project will not displace a substantial number of people.

Noise and vibration will cause displacement

I believe that the project will have a lot of construction impacts such as noise, vibration, and air quality impacts from the use of heavy machinery, such as pile drivers and beams. As a result I and other nearby residents may be displaced by the project. The City may benefit economically from the project. I am a retired resident of 24 years. My rents today is very low. If I am displaced by the construction, I will be effectively banished from El Segundo because I will not be able to afford rent in the area after I return post construction. 4-2

The developer and the City have a moral obligation to long-term residents like myself. The City should consider mitigation for residents like me with lower incomes. Maybe we can revisit this project every six months or every year so we can track the potential impact on residents like myself. 4-3

INTENTIONALLY LEFT BLANK

Response to Verbal Comment 4

Paul Morrison
Individual
December 9, 2021

4-1 This comment notes that he lives across for the proposed parking structure and expresses concerns with Project-related impacts, detailed below. This comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. Please see Responses to Comments 4-2 through 4-3 for more discussion.

4-2 This comment raises concern for the displacement of residents due to construction-related impacts associated with noise, vibration, and air quality, which would displace nearby residents. The Draft EIR analyzed impacts related to noise and vibration as well as air quality within Sections 4.10, Noise and 4.2, Air Quality, respectively. If impacts were determined to be potentially significant, mitigation was incorporated to reduce impacts to a less-than-significant level. All thresholds of significance for noise and air quality were reduced to be less than significant with the exception of Threshold 4.2(a), where it was determined that there is no feasible mitigation measure for population growth in the context of the assumptions underlying the Air Quality Management Plan. However, construction-related impacts associated with these environmental topic areas are not applicable to Threshold 4.11(b) regarding displacement of "substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere." Displacement refers to the physical displacement of people or housing. As described in Draft EIR Section 4.11, Population and Housing, no housing uses are located on the Project site and Project implementation would not require demolition of existing housing or displace people or housing. Construction-related impacts associated with the Project would not physically displace residents surrounding the Project site. No change or addition to the environmental analysis found within the Draft EIR is required.

4-3 In summary, this comment states the Project Applicant and the City should consider mitigation for residents with lower incomes. This comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. Furthermore, impacts to rents, for example, are outside the scope of CEQA. Per Section 15064(e) of the State CEQA Guidelines, "economic and social changes resulting from a project shall not be treated as significant effects on the environment."

In conclusion, the comment suggests periodic evaluation of the potential impacts as a result of the proposed Project. In accordance with CEQA Guidelines Section 15097, to ensure that the mitigation measures identified in the EIR are implemented, the City must adopt a program for monitoring or reporting on the measures it has imposed to mitigate or avoid significant environmental effects. The "mitigation monitoring and reporting program" is monitored by the City to ensure that all mitigation measures have been implemented to the satisfaction of the City. Additionally, the comment regarding periodic evaluation will be provided to City decision makers for their review and consideration.

Verbal Comment 5

Verbal Comment 5

Amalia Fuentes
December 9, 2021

The following represents a transcription of verbal comments provided at the December 9, 2021 Planning Commission meeting:

Indoor air quality

Referenced a written letter that was submitted on April 12, 2021 that has substantial evidence of a significant health risk impact from indoor air quality issues. Case law determines that agencies should study impacts on projects' residents. Future residents of the project will be exposed to a cancer risk of 120/1,000,000. Project employees will be exposed to a cancer risk of 17.7/1,000,000. Both of these exceed the California environmental quality act threshold of 10/1,000,000. This assumes that all the material will meet air quality management district regulations. 5-1

Diesel emissions

In addition to interior air quality impacts, the project will have diesel particulate matter impacts on sensitive receptors within 125 meters of the project site. These sensitive receptors will be exposed to a cancer risk of 79/1,000,000 which also exceeds the related threshold. 5-2

Greenhouse emissions

In addition, the environmental impact report has flaws in the calculations of greenhouse gas emissions from the project. 5-3

INTENTIONALLY LEFT BLANK

Response to Verbal Comment 5

Amalia Fuentes
Supporters Alliance for Environmental Responsibility ("SAFER")
Individual
December 9, 2021

5-1 The commenter referenced a written letter that was submitted on April 12, 2021 that has substantial evidence of a significant health risk impact from indoor air quality issues. Case law determines that agencies should study impacts on projects' residents. Future residents of the project will be exposed to a cancer risk of 120/1,000,000. Project employees will be exposed to a cancer risk of 17.7/1,000,000. Both of these exceed the California environmental quality act threshold of 10/1,000,000. This assumes that all the material will meet air quality management district regulations.

Workers are not considered sensitive receptors under CEQA but are covered by the standards and protocols of the Occupational Health and Safety Administration (OSHA). Discussion of impacts on indoor air quality on future occupants of new construction is not specified or required by the City's CEQA Guidelines, State CEQA Guidelines, or California's air district guidelines. California air districts base their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the state and federal ambient air quality standards (AAQS). The AAQS is based on maximum pollutant levels in outdoor air that would not harm the public's health. Furthermore, building materials are required to reduce exposure to toxic substances through compliance with the U.S. Environmental Protection Agency and the California Air Resources Board regulations, such as 40 CFR Part 770, Formaldehyde Emission Standards for Composite Wood Products. The regulations typically apply to manufacturers, distributors, importers, fabricators, and retailers of the products. All building materials used for the project would be required to comply with the applicable federal and state standards.

The Project (both nonresidential and residential uses) will need to comply with the 2019 CALGreen Code, which specifies that composite wood products (such as hardwood plywood and particleboard) meet the requirements for formaldehyde as specified in the California Air Resources Board's Air Toxic Control Measures. The 2019 CALGreen building code also does not allow added formaldehyde-based resins or ultra-low emitting formaldehyde resins and requires documentation of compliance with the California Air Resources Board's Air Toxic Control Measures. (See Section 5.504.4.5, Chapter 5, Part 11, 2019 California Green Building Standards Code, July 2019, incorporated herein by this reference.) Furthermore, the 2019 Title 24 standards increased the level of air filtration required for new residential construction, from minimum efficiency reporting value (MERV) 6 to MERV 13, per American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), with the stated goal of reducing indoor $PM_{2.5}$ concentrations. To accommodate the higher efficiency filter requirements, the proposed changes would also require that return grilles be able to accommodate at least a 2-inch deep filter to ensure that MERV 13 filters can be installed with minimal impact on HVAC system performance. MERV 13 filters remove at least 90% of particles sized 3.0 and 10.0 microns, 85% of particles sized 1.0 to 3.0 microns, and 50% of particles sized 0.3 to 1.0 microns, which would minimize the potential for new residents to be exposed to substantial TAC and $PM_{2.5}$ emissions. Furthermore, building materials will be required to comply with the California Air Resources Board and 2019 CALGreen building code.

The commenter's conclusions were not based on the assumption that the Project would be built in accordance with CARB's Air Toxic Control Measures and 2019 CALGreen building code. The commenter provides no evidence to substantiate a contrary conclusion that in spite of the proposed Project using materials that comply with the standards of the CARB's Air Toxic Control Measures, the proposed Project would still expose occupants to toxic substances that results in exceeding the SCAQMD CEQA significance health risk threshold. No changes to the Draft EIR is required.

5-2 The commenter states the Project will have DPM impacts on sensitive receptors within 125 meters of the project site. These sensitive receptors will be exposed to a cancer risk of 79/1,000,000 which also exceeds the related threshold.

Construction health risks were evaluated in the Draft EIR using the EPA and SCAQMD refined model, known as American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD). This model takes into account meteorological data and topographical data. It also accounts for the geography of a project site, locations of emissions sources, the time of day emissions would occur, locations of sensitive receptors, and other factors, which represents the real world environment. Based on the construction HRA using this refined model, AERMOD, using AERMOD methodologies from the SCAQMD, and using the age sensitivity factors and other health risk evaluation parameters recommended by the SCAQMD and the Office of Environmental Health Hazard Assessment (OEHHA), health risk impacts were determined to be less than the SCAQMD significance thresholds for cancer risk and non-cancer chronic risk for DPM after implementation of MM-AQ-1, which would require the use of Tier 4 interim equipment for all construction equipment greater than 75 horsepower.

The analysis assumes a construction start date of October 2021, which represented the earliest date of construction when air quality and GHG assessments were initiated.[4] Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant and GHG emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. Tier 4 standards for engine horsepower between 11 horsepower and 75 horsepower were available starting in 2008. For engines with horsepower between 75 and 175, Tier 4 engines were available starting in 2012. For engine horsepower between 175 and greater than 1,200, Tier 4 engines were available starting in 2011. As such, equipment engines that meet Tier 4 emission standards are currently available at the time of this analysis, and would continue to be available during the Project's construction years (through 2024). Please refer to the US EPA's Nonroad Compression-Ignition Engines: Exhaust Emission Standards for details (available: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1000A05.pdf).

Furthermore, an exemption from using Tier 4 equipment may be granted by the City of El Segundo if the Project proponent documents that equipment with the required tier is not reasonably available and provided corresponding reductions in criteria air pollutant emissions are achieved from other construction equipment. For example, if a Tier 4 Interim piece of equipment is not reasonably available at the time of construction and a lower tier equipment is used instead (e.g., Tier 3), another piece of equipment would be replaced with an alternative-fueled (not diesel-fueled) equipment to offset the

[4] As explained in Section 4.2 of the Draft EIR, October 2021 represents the earliest possible start date. In practice, construction may begin at a later date. However, using an earlier start date for construction represents the worst-case scenario construction impacts, because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles.

emissions associated with using a piece of equipment that does not meet Tier 4 standards. As such, the use of the air quality modeling results is correct and is appropriately relied upon. The Draft EIR adequately evaluated the proposed Project's potential health risk impacts from construction and determined that they would be less than significant after implementation of MM-AQ-1.

Therefore, based on the above considerations the Draft EIR's health risk analysis is adequate as presented.

5-3 The commenter states that the Draft EIR has flaws in the calculations of GHG from the Project.

The SWRCC letter included similar assertions related to the Draft EIR's greenhouse gas emission analysis. See Comment Letter 1 (Response to Comment 1-29) in this document. As discussed in this response, the comment raised has been addressed and no new significant environmental impacts were raised that were not adequately addressed through the Draft EIR.

Verbal Comment 6

Verbal Comment 6

Maria Barron
Resident
December 9, 2021

The following represents a transcription of verbal comments provided at the December 9, 2021 Planning Commission meeting:

I live at 1628 E. Palm Ave. 6-1

Noise, pollution and parking

I concur with all the concerns that were mentioned by the previous speakers. I am concerned about noise, pollution, and parking. 6-2

Parking permits.

However, I disagree with the suggestion that the project residents should get the parking permits. Instead I think it will be best for existing residents in the area to have parking permits so they can park on the street. 6-3

Noise and pollution from the project will be unbearable for nearby residents. 6-4

The City previously had a program to provide double-paned windows to residents and my residence qualified for this program. However, the program ran out of funds. So, we won't be getting them. I recommend that the city revisit the program to provide a double-paned windows for residents. 6-5

I believe the project proposes too many apartment units and the proposed buildings and parking structures are too tall. 6-6

INTENTIONALLY LEFT BLANK

Response to Verbal Comment 6

Maria Barron
Individual
December 9, 2021

6-1 This comment provided the resident's address, which is within the vicinity of the Project site. However, this comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. No response is required.

6-2 The comment expresses similar concerns as mentioned by other speakers related to noise, pollution, and parking. The comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. For informational purposes, the Sections 4.10 (Noise), 4.2 (Air Quality), 4.8 (Hydrology and Water Quality), and 4.13 (Transportation) address the aforementioned areas of concern. No further response is required.

6-3 This comment disagrees with the suggestion made by Nino Mascolo (see Response to Comment 1-2) regarding parking permits for Project residents. Instead, this comment suggests parking permits should be given to existing residents surrounding the Project site to allow for parking on the street. This comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. No response is required. Nevertheless, this comment will be provided to City decision makers for their review and consideration.

6-4 In summary, this comment states Project-related impacts associated with noise and pollution will be "unbearable" for nearby residents. The Draft EIR analyzed Project-related impacts in accordance with the State CEQA Guidelines and existing relevant plans, policies, and programs. As mentioned above, Sections 4.10 (Noise), 4.2 (Air Quality), and 4.8 (Hydrology and Water Quality) address the aforementioned environmental topics of concern. Impact determinations are summarized in Table ES-1 as mentioned previously. If impacts were determined to be potentially significant, mitigation was incorporated to reduce impacts to a less-than-significant level. All thresholds of significance for noise, air quality, and hydrology and water quality were reduced to be less than significant with the exception of Threshold 4.2(a), where it was determined that there is no feasible mitigation measure for population growth in the context of assumptions used for the SCAQMD's Air Quality Management Plan. Nevertheless, this comment will be provided to City decision makers for their review and consideration.

6-5 This comment notes a City program that provided double-paned windows to residents. However, the comment states the program ended and asks for the program to be restored. This comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. No response is required. Nevertheless, this comment will be provided to City decision makers for their review and consideration.

6-6 In summary, this comment states opposition to the Project's proposed residential unit count and proposed height. The commenter's general opposition to the Project will be provided to the City's decision makers for their review and consideration.

INTENTIONALLY LEFT BLANK

Verbal Comment 7

Verbal Comment 7

Matthew Klemp
Resident
December 9, 2021

The following represents a transcription of verbal comments provided at the December 9, 2021 Planning Commission meeting:

Corner of Washington Street and Elm Avenue.

I previously submitted two letters commenting on the environmental impact report but I have not received a response other than that they will be included in the record. 7-1

My concerns related to noise, parking, and traffic.

The Environmental impact report makes some questionable key assumptions. A lot hinges on a lot of people walking to the downtown, or walking to mass transit, or taking mass transit. But that has not been the case here in El Segundo or in the Los Angeles area. It would be great if we had mass transit available, but it is not here. 7-2

Reduced parking requirements

In addition, a lot hinges on the assumption that two people living in one unit will use only a single car. That does not meet El Segundo's current parking standards. In addition, no one really walks from Pacific Coast Highway to downtown El Segundo. In addition, traffic on Mariposa Avenue is backed up especially when making a left turn onto Pacific Coast Highway. So, the additional traffic will make things worse on Mariposa Avenue. In addition, the environmental impact report excludes single-family homes from the sensitive receptors of unwanted noise. 7-3

High density and traffic/parking

The project brings high density residential to this neighborhood that already has a parking and traffic problem. Adding all those units in this small area will make park parking and traffic is much worse 7-4

Alternative sites.

Why can't we rezone somewhere else in the city to accommodate all these new residents. 95% of residents in the city live in approximately 25% of the city's area. South of Grand Avenue and east of Pacific Coast Highway would be appropriate places to rezone and would take away a lot of the objections to the project if those alternative site where evaluated and developed. 7-5

INTENTIONALLY LEFT BLANK

Response to Verbal Comment 7

Matthew Klemp
Individual
December 9, 2021

7-1 In summary, this comment states he lives nearby the Project site. In addition, the commenter notes two previously submitted letters on the Draft EIR but states no response other than they would be included in the administrative record was made. Please see Response to Comment I-21 within Chapter 2, Responses to Comments, of the Final EIR for more discussion on previously submitted comments from "Matthew Klemp".

Additionally, the comment expresses concern related to noise, parking, and traffic. The Draft EIR analyzed Project-related impacts in accordance with the State CEQA Guidelines and existing relevant plans, policies, and programs. Sections 4.10 (Noise) and 4.13 (Transportation) address the aforementioned topics of concern. Impact determinations are summarized in Table ES-1 as mentioned previously. If impacts were determined to be potentially significant, mitigation was incorporated to reduce impacts to a less-than-significant level. All thresholds of significance for noise and transportation were reduced to be less than significant. This comment does not express specific concerns related to the adequacy of the Draft EIR's environmental analysis. No further response is required.

7-2 In summary, this comment questions the Draft EIR's assumptions of walkability and transit of current and future residents and visitors of the city. The following response includes portions of Response to Comment Letter I-21 (included within Chapter 2, Responses to Comments, of the Final EIR):

The EIR evaluates the environmental impacts of the proposed Project based on the existing conditions of the Project site and area; applicable standards that are in place at the local, regional, state, and national levels; and, conservative assumptions based on default data from similar project types. While the availability of transit and the mixed-use nature of the Project and its surroundings may present a potential environmental benefit and are features discussed in the EIR, the environmental conclusions in the EIR do not hinge upon widespread use of alternative transport modes amongst the future residents, employees, guests, and visitors of the proposed Project. Rather, the analysis assumes that a majority of the future residents, employees, guests, and visitors would use single-occupancy vehicles.

Regarding the Project's proximity to downtown El Segundo, the distance is approximately 1.5 miles, which equates to an approximately 30-minute walk. While the potential for walking to downtown is mentioned in the EIR and is set forth as part of one of the Project objectives, the analysis in the EIR is not based on the potential for future Project residents to walk to downtown El Segundo. Rather, a conservative trip credit for alternative transport modes was taken for the purposes of the Project's vehicle trip calculations. The trip credit is minimal (5% of the Project's total vehicle trips) and is based on the mixed-use nature of the Project and Project area, combined with proximity to transit.

The analysis in the EIR assumes that 5% of the Project trips would take transit, walk, or bike. However, U.S. Census data from 2019 shows that 6.7% of residents in El Segundo take transit, walk, or bike. As such, data collected in the Project area indicates that the assumptions in the EIR analysis for use of alternative transportation modes are conservative in nature and that the EIR assumes reduced use of alternative transportation modes relative to current rates of use in the surrounding community. While

the EIR describes the transit-oriented nature of the proposed Project and its proximity to existing businesses and services, the quantitative analyses (e.g., traffic generation, traffic-related noise generation) remain conservative with respect to vehicle use versus alternative transportation use. Furthermore, no additional walk/bike/transit trip generation credit was taken in the Draft EIR for the Project's proximity to Downtown El Segundo.

The comment also states that there is a lack of reliable transit in the Los Angeles area. However, the Metro C Line Mariposa Station is 0.51-mile from the Project site. Metro Line 232, LADOT Commuter Express Line 574, and Beach Cities Transit Line 109 also run along Pacific Coast Highway with stops near the Project site. Metro C Line Mariposa Station is considered to be within walking distance of the Project site (see Appendix J-1 of the Draft EIR). The distance between the Project site and the Mariposa Station equates to an approximately 12-minute walk. Metro Route 232 has average headways of 20 minutes during weekday morning peak periods and 30 minutes during weekday afternoon peak periods (Draft EIR, Appendix J-1). Furthermore, to provide a better bus system for Los Angeles County, the NextGen Bus Plan was approved in October 2020 by Metro. Service improvements are planned for Metro Route 232 to provide a 15-minute frequency during peak hours. Nevertheless, as described above, the trip credits taken in the EIR analysis for transit use are conservative with respect to existing reliance on transit, walking, and bicycling in the surrounding community.

Finally, the Project site is adjacent to a transit-priority area, which is an area delineated by SCAG to identify locations where transit use is practical and where transit-oriented development is encouraged. Plans and policies are in place at the local, regional, and state level to encourage increased use of alternative modes of transportation and to support mixed-used and higher density housing near transit. The proposed Project is supportive of these policies, as it would locate higher density housing and mixed-use development in proximity to transit. As these plans and policies are carried out, the use of alternative modes of transportation is also expected to increase over time, particularly in urbanized areas.

7-3 In summary, this comment questions the Draft EIR's assumptions of vehicles per unit for future residents of the proposed Project. The proposed Project includes an adequate amount of parking and would provide parking garages for the on-site residents, hotel guests, employees, and restaurant/retail patrons. Because the proposed Project would provide sufficient parking, and because parking adequacy is not considered an impact on the environment, no parking-related mitigation measures are required under CEQA. While CEQA does not require an analysis of parking, a parking evaluation was nevertheless included as part of the Draft EIR for informational purposes and in response to community concerns For more information, please see Section 4.13.4 of the Draft EIR and Appendix J-2 of the Draft EIR. No change or addition is required of the Draft EIR's environmental analysis. Nevertheless, this comment will be provided to City decision makers for their review and consideration.

Additionally, the comment asserts walkability assumptions within the Draft EIR. For more discussion on walkability, please see Response to Comment 7-2, above.

The comment also raises concerns for traffic congestion on Mariposa Avenue and Pacific Coast Highway. The commenter's concern for traffic congestion is no longer considered an environmental topic of concern under CEQA (California Public Resources Code Section 21099(b)(2)). The Draft EIR includes information on intersection operations and congestion level of service (i.e., LOS) for informational purposes only. The analysis is included as it relates to the applicability of General Plan policies (see Draft EIR, Section 4.13 and Appendix J-1). Although, automobile delay and traffic

congestion are not considered to be impacts on the environment, analysis was prepared related to the Project's consistency with Section 15064.3(b) of the State CEQA Guidelines.

Finally, the comment asserts the Draft EIR excludes single-family homes as sensitive receptors to noise. This comment is similar to Comment I21-8 (included within Chapter 2, Responses to Comments, of the Final EIR). The comment incorrectly states that single-family homes were not included in the noise analysis for the Draft EIR. As noted in Section 4.10, Noise, of the Draft EIR:

> "Additional sensitive receptors are located farther from the Project site in the surrounding community, such as single-family residences west of Washington Street, and due to this increased distance (over 500 feet from the Project boundary), those receptors would be less impacted by noise and vibration levels than the above-listed sensitive receptors" (Draft EIR pages 4.10-5 and 4.10-6).

Therefore, single-family homes were not excluded from the Draft EIR as noise-sensitive receptors; the nearest sensitive receptors are analyzed to provide the most conservative analysis. No change or addition is required of the Draft EIR's environmental analysis.

7-4 In summary, this comment states opposition to the Project's proposed density, trip generation, and parking. The comment asserts the proposed Project would exacerbate existing parking and traffic conditions. For discussion on the Project's impacts to parking and traffic, see Response to Comment 7-3, above. The commenter's general opposition to the Project will be provided to the City's decision makers for their review and consideration.

7-5 In summary, this comment states alternative sites should be considered for the proposed Project. This comment is similar to Comment I21-12 (included within Chapter 2, Responses to Comments, of the Final EIR). As such, following response includes portions of Response to Comment I21-12:

Alternatives to the proposed Project, including alternate locations, are evaluated in Chapter 6 of the Draft EIR. Alternate locations to the proposed Project site were ultimately rejected as infeasible. The reasons for this conclusion are summarized below, followed by a description as to why the commenter's specific suggestions for alternate locations are determined to be infeasible.

Infeasibility of Alternate Locations

1) Alternate locations would not avoid or reduce the Project's environmental impacts. As stated in Section 15126.6(f)(2)(A) of the CEQA Guidelines, the key question and first step in analyzing alternative sites is whether any of the significant effects of a project would be avoided or substantially lessened by putting that project in another location. Only locations that would avoid or substantially lessen any of the significant effects of a project need to be considered in the EIR. There are no significant and unavoidable impacts associated with the proposed Project that relate to the location of the Project site, and development of the Project on another site in the City is not likely to lessen or avoid the environmental impacts that require mitigation. Rationale for this determination is provided in Section 6.4 of the Draft EIR.
2) No known sites are available within the City of an approximately equivalent size to the Project site that could be redeveloped with a mixed-use, hotel, commercial, and residential development. One of the factors for feasibility of an alternative, as defined in the CEQA

Guidelines, is "whether the proponent can reasonably acquire, control or otherwise have access to the alternative site." The City evaluated the possibility for other sites, and this evaluation is summarized in Section 6.4 of the Draft EIR. The City determined that potential alternate locations were not suitable due to a variety of factors (land use designations, hazardous site conditions, and/or property ownership.)

Suggested Alternate Locations

The commenter's specific suggestions for alternate locations are addressed as follows:

- **East of Pacific Coast Highway or south of Grand Avenue.** The commenter suggests developing the proposed Project on the east side of Pacific Coast Highway and/or to the south of Grand Avenue. The commenter presents the option of rezoning a site on the east side of Pacific Coast Highway to accommodate mixed-use residential. As stated in Section 6.4 of the Draft EIR, development of the Project on another site along Pacific Coast Highway could provide a transition from the City's offices to the east and residential uses to the west, similar to the proposed Project site. However, other sites along Pacific Coast Highway were determined to be infeasible because no such sites are under control by the Project applicant, which is a factor for feasibility under CEQA. Additionally, other sites along Pacific Coast Highway may not be considered by the City to be appropriate for the increased height and density that is proposed for the Project. Furthermore, locating residential uses east of Pacific Coast Highway would place new residents farther away from services and amenities, such as parks, City Hall, the police station, and schools. This may result in increased vehicle trips within the City and/or increased development impacts, in the event that new public services and amenities need to be developed elsewhere in the City. Residents would also be required to cross Pacific Coast Highway to access public services, which could present increased traffic safety effects. The City did consider a parcel located near Pacific Coast Highway and Rosecrans Avenue, between The Point Shopping Center and Plaza El Segundo. However, the parcel is between two sets of railroad tracks and is contaminated due to historic heavy industrial uses. Further, the former owner, Chevron, recorded restrictions on most of the properties in this area to prohibit residential and hotel uses. In general, the areas south of Grand Avenue are highly industrialized, and adding residences to this area would likely introduce an incompatible land use.

In conclusion, the City acknowledges the comment and it will be provided to City decision makers for their review and consideration.

Exhibit No. 12

Request for Street Dedication Waivers & Waiver of Construction for Certain Future Right-of-Way Improvements Relating to The Pacific Coast Commons Project (Addresses: 475, 525, 545 and 600 block of Pacific Coast Highway)

Introduction

There are 5 streets abutting the Pacific Coast Commons Project: Pacific Coast Highway (formerly Sepulveda Boulevard), Indiana Street, Palm Avenue, Holly Avenue, and Mariposa Avenue. The El Segundo Circulation Element sets forth the street classification for streets and the planned right-of-way/roadway requirements relating to those streets.

Table 1 sets forth: the street; the classification of each street; the minimum/maximum roadway width and other right-of-way requirements; the existing conditions; the City requested dedications; and the applicant's request for waiver; modification and deferment of meeting the City's requested dedications.

The column for City Required Dedication is based upon written communication received from the City of El Segundo Public Works Department and the Planning and Building Safety Department (collectively "City") on September 18, 2020 and October 21, 2020.

The City's request for street dedication provides for the maximum allowed right-of-way widths proposed in the Circulation Element of the General Plan for Palm Avenue, Holly Avenue, Mariposa Avenue, and Indiana Street (excepting those portions of the frontage of Indiana Street where the existing Fairfield Inn and Suites and Aloft hotels are located).

The City has classified the block of Holly Avenue that fronts the project site between Pacific Coast Highway and Indiana Street as a local commercial street. Holly Avenue is 50 feet in width. The City has requested the maximum allowed right-of-way width of 64 feet. Therefore, the City's request is to provide a right-of-way dedication of 7 feet on the north side of Holly Avenue along the street frontage of the development project. The applicant proposes to dedicate the 7 feet. Additionally, the applicant agrees to construct the physical right-of-way improvements subject to credit against the cost of applicable City's traffic mitigation fees for the project since the project did not generate any impacts that necessitated the right-of-way improvements (see Section entitled "Dedications Considered Taking if No Nexus Exist" at the end of this application request for further information).

Pacific Coast Highway (which is a State Highway) is 125 feet in width and 85 feet greater than ½ of the required maximum right-of-way width has been provided through previous dedications and easements already for the project (western) side of the street.

It is important to note that as shown in Table 2, all of the streets that surround the project site already comply with the following right-of-way/roadway requirements even before any proposed street dedications requirements: a) minimum roadway width necessary for emergency vehicle access; b) minimum roadway width and lane width necessary for safe two-directional vehicle passage (minimum of 20 feet); c) minimum lane width of ten feet (10') for a travel lane; d) minimum width of eight feet (8') for a parking lane; and e) 44-inch minimum width for disabled access requirements for public sidewalks.

Summary of Impacts of Proposed Street Dedications

Some of the street dedications proposed by the City create significant hardships outlined below that would otherwise deprive the applicant full use of its property and result in an inferior project.

All of the combined street dedication requirements outlined in Table 1 result in the following significant impacts and hardships on the project; the impacts from each specific dedication requirement are detailed below in the specific discussion of that street:

- Loss of 159 parking spaces
- Loss of 70 residential units at currently proposed parking ratios
- Loss of ground floor restaurant and retail space
- Increased cost of parking structures

The applicant proposes that waivers of full or partial proposed street dedications be granted for Indiana Street and that the applicant not be required to construct certain right-of-way improvements for Palm Avenue, the east side of Indiana Street and the north side of Mariposa Avenue as explained more fully below.

These requests are warranted for this project and comply with the City's waiver criteria as specified per ESMC Section 15-24A-5 "Relief from Requirements" below:

Waiver Criteria:

1. The proposed waiver maintains the minimum roadway width necessary for emergency vehicle access as determined by the fire chief.
2. The proposed waiver maintains the minimum roadway width and lane widths deemed necessary for safe two-directional vehicular passage. The minimum lane width cannot be less than ten feet (10') in width for a travel lane and eight feet (8') feet in width for a parking lane;
3. The proposed waiver will maintain the necessary roadway width for the traffic volumes projected during the general plan buildout as determined by the director of planning and building safety, unless the director determines that the dedication or irrevocable offer to dedicate will require the removal of all or a portion of an existing building.

4. The proposed waiver complies with any requirements of state and federal regulations, including, without limitation, disabled access requirements for public sidewalks;
5. The proposed waiver would not be detrimental to the neighborhood or district in which the property is located;
6. That the proposed waiver is necessary in order that the applicant is not unreasonably deprived the use or enjoyment of his property; and
7. The proposed waiver is consistent with the legislative intent of this title.

Street Dedication Waiver Requests and Requests to Not Construct Certain Future Right-of-Way Improvements

Palm Avenue – South Side.

Request to not construct right-of-way improvements.

Impacts of construction of right-of-way improvements:

- Unsafe and unsightly street condition with widening of roadway and sharp jog in the public sidewalk unless acquisition occurs for additional street frontage for widening on the south side of the block of Palm Avenue between Pacific Coast Highway and Washington Street.

The City's request is to provide a right-of-way dedication of 12 feet on the south side of Palm Avenue along the street frontage of the development project. The applicant proposes to dedicate the 12 feet but requests that they not be required to construct any of the right-of-way improvements.

The property frontage of the project site is only 73.19 feet in width on a block that is 806 feet in length. The block is predominantly comprised of residential uses which are the sole uses to the west of the project site and across the street from the project site. The only fully commercial uses being the Carl's Jr. Restaurant to the east of the project site at the corner at Pacific Coast Highway and the vacant Stick and Stein restaurant across the street from Carl's Jr. on the north side. Despite the limited commercial uses, City staff has determined that the street should be classified as a local commercial street.

The minimum width requirements for both local residential and local commercial street classifications are 60 feet. The only difference in the roadway width between the two is that the local commercial street also has a maximum width of 64 feet to allow for 2-foot wider parking lanes. Although it is unclear what necessitates a wider roadway width for this portion of the block, nonetheless, the project has been designed to accommodate a 12-foot right-of-way expansion as opposed to a 10-foot right-of-way expansion.

Street dedication and physical improvements for this approximately 73 feet of frontage would create an unsafe street condition by widening a small section of the street by 12 feet, creating a significantly recessed driveway with impaired visibility of oncoming traffic without acquisition and widening of the entire street, and a sharp jog in the public

sidewalk. Therefore, this request is for the City to not require construction of the public right-of-way improvements (roadway widening, relocation of sidewalk and installation of new parkway) for the 12-foot width for expansion on the south side of Palm Avenue. The existing roadway and 5-foot sidewalk would be maintained. The area for future dedication would be landscaped yard area until such future time as the dedication is executed and the physical improvements would be implemented.

Compliance with Waiver Criteria

The City's request for dedication of 12 feet of land for right-of-way expansion would occur prior to Certificate of Occupancy for the North Site development phase of the project. Granting the request to not construct the right-of-way improvements on the south side of Palm Avenue would maintain the existing 40-foot right-of-way and 5-foot sidewalk until the street is widened in the future. The existing right-of-way dimensions would be in conformance with the requirements for the minimum roadway width for emergency vehicle access, safe two-directional vehicular passage, minimum travel lane widths, and sidewalk accessibility requirements until the irrevocable offer to dedicate land is implemented in the future.

Indiana Street.

Waiver for reduction of 7 feet on the project side of the street to a 0-foot dedication. (City staff from the Public Works and Planning Departments jointly issued a determination on October 21, 2019 that no dedication would be required for the portion of Indiana Street where the two existing hotels (Aloft and Fairfield Inn and Suites) are located since the existing buildings have no setback from the existing right-of-way, However, it is referenced in this application as the applicant asks that one comprehensive determination is issued that addresses all of the requests. The request for waiver for the remainder of the block between Mariposa and Holly Avenue for the two new development areas ("PCC South Site" and the "Fairfield Parking Site") at the south and north ends of the block respectively is for a reduction of 3 feet to a 4-foot dedication. Request to not construct right-of-way improvements on Indiana Street other than parkway landscaping.

Impacts of a 7-foot dedication on PCC South in lieu of a 4-foot dedication:

- Need to use speed ramp
- Loss of 94 parking spaces due to speed ramp
- Speed ramp may require all traffic to enter on Indiana instead of PCH
- Reduction of courtyard area
- Elimination of ground floor retail & restaurant uses
- Loss of 62 residential units based upon the current proposed parking requirement

Impacts of a 7-foot dedication on the Fairfield Inn and Suites Replacement Parking Structure in lieu of a 4-foot dedication:

- Loss of 10 parking spaces
- Possible reduction or loss of ground floor retail & restaurant uses

The majority of the block is occupied by the existing hotel buildings which will remain (the Aloft and Fairfield Inn and Suites hotels). These hotels were recently acquired in 2017 for $90,000,000 and their high value make it extremely unlikely that the hotels would be demolished in any reasonably foreseeable amount of time to achieve widening of the street along the entire east side of Indiana Street on this block.

A 7-foot dedication would make the current ramping system of PCC South infeasible because the reduced length of ramp would require an increased slope that would not permit parking on the ramp and result in the need to use a speed ramp (A steeply sloping vehicular ramp in which the steeper slope prohibits cars from parking on the ramp as is typical in many parking structures). The speed ramp would eliminate approximately 94 parking spaces, resulting in the loss of 62 multiple-family residential units at the currently proposed parking ratios in addition to elimination of the ground floor retail and restaurant uses. Another potential impact of being required to use a speed ramp is that all traffic for both the Aloft Hotel and the residential development may need to come in and exit from Indiana Street rather than having Aloft hotel traffic enter and exit from Pacific Coast Highway.

The replacement Fairfield parking structure located south of Mariposa is also the most constrained structure on the project site given the distance between the existing Fairfield improvements and the street dedication line of Indiana Street and Mariposa Avenue. The 7-foot dedication requirement on Indiana Street would result in a loss of approximately 10 parking spaces and potential reduction or elimination of the commercial and retail uses on the ground floor along Pacific Coast Highway.

Compliance with Waiver Criteria

The existing street right-of-way width is 50 feet (including existing easements). The applicant proposes to grant a street dedication to replace the existing easements so that the City will own all of the existing 50-foot right-of-way. This street dedication will occur once the proposed Vesting Tentative Tract Map No. 82806 is approved and recorded.

A 0-foot dedication for any additional right-of-way will still allow the City to maintain roadway and sidewalk dimensions in compliance with the minimum right-of-way standards for a local commercial street (12-foot travel lane, 8-foot parking lane and a 5-foot wide sidewalk) and in compliance with Waiver Criteria Nos. 1, 2 and 4. The 7-foot dedication would only accommodate the addition of a parkway that does not exist today and involve the widening of the parking lane from 8 feet to 10 feet. A 4-foot dedication will be provided along the portions of the block where the new development areas ("PCC South Site" and the "Fairfield Parking Site") are located and will generally include landscaping. Additional landscaping will be provided where feasible on the project site in the new Pacific Coast Commons project and where it exists today on the existing Fairfield and Aloft hotel parcels. Throughout the City where parking lanes are permitted and provided, they are 8 feet in width. It is unclear what analysis has been conducted to determine the necessity of a 10-foot wide parking lane on this particular block in comparison to other local commercial and residential streets in the area or City generally. Further, Indiana Street is a short street that only runs 3 blocks and truly is a local street that only serves the immediate neighborhood.

This request would also meet Waiver Criteria Nos. 3, 5, 6 and 7. The necessary roadway width will be provided and maintained in compliance with the Circulation Element. This waiver request will not result in a reduction of roadway width or a reduction in the number of lanes. The project with the proposed reduced dedication will meet the 5-foot sidewalk requirement and exceed the 44 inches required to meet disabled access requirements. The proposed waiver would not be detrimental to the neighborhood or district in which the property is located as the minimum roadway and sidewalks will be provided. No parkway exists currently. The additional 4-feet of dedication will allow for the addition of parkway for the portions of the block where the new development occurs and additional on-site landscaping adjacent to the right-of-way will be provided where feasible in locations where buildings are not proposed or are not currently located. The proposed waiver is consistent with the legislative intent of Title 15 in that the proposed waiver will still allow a roadway and a sidewalk in compliance with the minimum width standards for a local commercial street specified in the Circulation Element. Although the City is not requiring any dedication for the portion of the street where the existing Aloft and Fairfield Inn and Suites are located and are not proposed to be demolished, it should be noted that Waiver Criteria No. 3 specifically addresses the justification for a waiver if the dedication requires the removal of all or a portion of an existing building.

Mariposa Avenue – South Side.

Waiver for reduction of 3 feet to provide only a 4-foot dedication for the portion of the block westerly of the proposed right-turn lane.

Impacts of a 7-foot dedication on the Fairfield Inn and Suites Replacement Parking Structure:

- Elimination of a row of parking on all levels resulting in loss of 55 parking spaces
- Require increased building height with an additional 1.5 to 2 stories of parking
- Inefficient parking structure design with significantly higher costs per stall
- Possible elimination of ground floor restaurant and retail uses

The south side of Mariposa is the most constrained aspect of the entire project. The distance between Mariposa and the existing Fairfield hotel buildings that will remain are so tight that there is barely room to fit two drive aisles and a ramp. The 7-foot dedication requirement on Indiana Street would not provide sufficient room for the parking structure to have a ramp and two double loaded drive aisles and would result in a single loaded drive aisle configuration that would result in a loss of approximately 10 parking spaces per floor for a total loss of 50 parking spaces (this would increase the loss to 60 parking spaces if the 7-foot setback on Indiana was also implemented). This would result in an increase of height for the parking structure by 1.5 to 2 levels, in addition to possible elimination of the commercial and retail uses on the ground floor along Pacific Coast Highway. In addition, the resulting structure would be so inefficient that it would result in significant additional cost to construct the same number of parking spaces. The combination of the reduction of the parking structure footprint and spaces from the street dedication requirements on Indiana Street and Mariposa Ave would also make it

difficult to provide the necessary replacement parking for the Fairfield Hotel in addition to possibly eliminating the ground floor retail and restaurant uses.

Additionally, the applicant requests a waiver for any additional street dedication at the location of the proposed newly created right-turn lane as this turn lane is wider than the current street dedication requirements by five feet. The project should not be required to provide any additional dedication other than to realign the existing sidewalk southward with the installation of the right-turn lane, since the right-turn lane provides additional land to the City greater than the street dedication requirement. Twelve feet of right-of-way width is proposed for dedication for the length of the proposed right-turn lane (where only 7 feet is required). The right-turn lane is approximately 55 feet in length for the portion that is fully 10-feet wide not including the transition into the lane. It should be noted that these dimensions for the length of the right-turn lane are approximate as the project has not been prepared to construction level drawings. The roadway widening and addition of the right-turn lane would be fully designed after project approval with detailed design specifications for review by the City of El Segundo and Caltrans (since the right-turn lane would intersect with Pacific Coast Highway (a state highway.) This additional width will allow for a 12-foot center travel lane, a 10-foot lane, the proposed new 10-foot wide right turn lane, as well as a 5-foot sidewalk, all in compliance with the Circulation Element.

The existing street right-of-way width is 50 feet. A 4-foot dedication on the westerly portion of the block when added to the existing right-of-way will result in a 12-foot travel lane, a 10-foot curb lane, and a 5-foot sidewalk in compliance with the right-of-way standards for a 4-lane collector. The waiver request would result in a 2-foot parkway where a 5-foot parkway is required for a 4-lane collector; however, there is currently no parkway or landscaping along this right-of-way currently. The ability to provide some parkway landscaping in addition to full compliance with the roadway and sidewalk requirements still meets all of the waiver criteria and legislative intent of the General Plan and zoning regulations because no parkway exists today and it will improve the existing conditions by adding some landscaping along with the public benefit of the proposed right-turn lane.

Compliance with Waiver Criteria

This waiver request would meet all waiver criteria - The necessary roadway width will be provided and maintained in compliance with the Circulation Element. This waiver will not result in a reduction of roadway width or a reduction in the number of lanes. The project with the proposed 3-foot reduced dedication will still increase the right-of-way width of Mariposa Avenue and it only affects a portion of the block. A right turn lane and additional improvements will be provided for the remainder of the block that when added to the existing right-of-way will be wider than the right-of-way requirements in the Circulation Element. The project will meet the 5-foot sidewalk requirement and exceed the 44 inches required to meet disabled access requirements. The proposed waiver would not be detrimental to the neighborhood or district in which the property is located as the minimum roadway and sidewalks will be provided and the project will improve the existing roadway, sidewalk and parkway conditions. The proposed waiver is consistent with the legislative intent of Title 15 in that the proposed waiver will still allow a street

dedication that will expand the right-of-way in compliance with the minimum roadway standards and sidewalk standards for a 4-lane collector in the Circulation Element and a 2-foot parkway will be provided where none exists currently. Additionally, unusual conditions exist with existing buildings that constrain removing a portion of one of the existing buildings (Fairfield Inn and Suites "Food and Beverage" building) and replacing it with required parking in a parking structure in the exact same location as the existing Food and Beverage building which has a 0-foot setback from the Mariposa Avenue public right-of-way.

Mariposa Avenue – North Side.

Request to not construct right-of-way improvements on the north side of Mariposa Avenue.

Impacts of construction of right-of-way improvements:

- Unsafe and unsightly street condition with widening of roadway by 7 feet and sharp jog in the public sidewalk unless acquisition occurs for additional street frontage for widening on the north side of the block of Mariposa Avenue between Pacific Coast Highway and Washington Street.

The City's request is to provide a right-of-way dedication of 7 feet on the north side of Mariposa Avenue along the street frontage of the development project. The applicant proposes to dedicate the 7 feet but requests that they not be required to construct any of the right-of-way improvements.

The property frontage of the project site (north side) is approximately 163 feet in width. The blocks between Pacific Coast Highway and Washington Street span 806 feet in length. Only residential uses are located west of the project site. No parking is permitted on Mariposa Avenue and the site is sandwiched between the gas station property and the residential properties to the west.

Construction of the physical improvements for this approximately 163 feet of frontage would create an unsafe street condition by widening a small section of the street by 7 feet in the middle of the block, creating a recessed driveway with impaired visibility of oncoming traffic without acquisition and widening of the entire street, and a sharp jog in the public sidewalk that is not conducive to pedestrian pathway requirements. Therefore, this request is for the City to not require that the applicant construct the public right-of-way improvements (roadway widening, relocation of sidewalk and installation of new parkway) for the 7-foot width for expansion on the north side of Mariposa Avenue. The existing roadway and sidewalk would be maintained. The area for future dedication would be landscaped yard area until such future time as the dedication is executed and the physical improvements would be implemented.

Compliance with Waiver Criteria

The City's request for dedication of 7 feet of land for right-of-way expansion would occur prior to Certificate of Occupancy for the North Site development phase of the project. Granting the request to not construct the right-of-way improvements on the north side of

Mariposa Avenue would maintain the existing 50-foot right-of-way and variable width sidewalk (5-foot minimum) until the street is widened in the future.

The right-of-way includes a variable roadway width and sidewalk width currently. A 7-foot dedication when added to the existing right-of-way will result in a 12-foot travel lane, a 10-foot travel/parking lane, and a 5-foot sidewalk, and a 5-foot parkway in compliance with the right-of-way standards for a 4-lane collector.

The area that would be affected is a limited amount of street frontage on a very long block comprised of existing older residential uses and a gas station. Additionally, the project site frontage on the north side of Mariposa is occupied by a driveway access that also serves as a fire lane that is required by the Fire Department that will remain in the proposed project.

The existing right-of-way dimensions would be in conformance with the requirements for the minimum roadway width for emergency vehicle access, safe two-directional vehicular passage, minimum travel lane widths, and sidewalk accessibility requirements and the existing conditions would remain until such future time as the physical improvements would be constructed.

Additional Considerations

Deferral of Dedication of Land and Construction of Right-of-Way Improvements on Mariposa Avenue and Holly Avenue.

The City cannot require right-of-way dedications for the streets surrounding the project site until each of the three phases of development occur. The only exception is that the proposed dedications of Indiana Street and Holly Street (existing half of the 25-foot wide street easements would be required and occur with the recordation of Vesting Tract Map No. 82806.

First, the City cannot require implementation because the entire project site has existing active uses (the two existing hotels) that will remain and the City can only require implementation at such time as the applicant constructs the project entitlements. The existing Food and Beverage Building that is part of the Fairfield Inn and Suites Hotel will remain and can be used in the interim for permitted uses until such time as it is demolished to allow for construction of the new development at the “Fairfield Parking Site.’ The two other development sites (“South Site” and “North Site”), contain parking that is required for the two existing hotels and cannot be removed until such time as the applicant implements each respective phase of the development project.

The applicant requests that the City include a condition of approval that requires the dedications of land for right-of-way purposes would occur upon completion of construction before Certificates of Occupancy are issued for each development phase. The applicant requests that the City include a second condition of approval that would require construction of right-of-way improvements on Mariposa Avenue and Holly Avenue to commence once building permits have been issued for their associated

development phase and that they must be completed before a Certificate of Occupancy for that development phase is issued.

Waiver of Requirement to Construct Right-of-Way Improvements on Indiana Street, Palm Avenue, and the North Side of Mariposa Avenue

Due to the fact that there is not sufficient land available to complete the right-of-way requirements the full length of each block on these streets, the applicant requests a waiver to construct the right-of-way improvements for Indiana Street, Palm Avenue and the north side of Mariposa Avenue. Creating intermittent widening and narrowing of streets in this area will create unsafe driving conditions, lane width confusion, merging issues, and also create a disjointed street frontage that is not conducive to pedestrian travel paths.

Minimum vs. Maximum Commercial Street Width

The dedication requirements that the City believes are applicable to Palm Avenue, Indiana Street and Holly Avenue are based upon the local commercial street classification and are further based upon the maximum right-of-way width (64 feet) rather than the minimum right-of-way width (60 feet) for a local commercial street. The 4-foot difference relates to the width of the parking lanes on both sides of the street and whether they are 8 feet wide or 10 feet wide. If the City did not impose the maximum regulations, then the waiver request on Indiana Street would be reduced from 7 feet to 5 feet for the portion of the block where the existing hotels are located and from 7 feet to 1 foot for the portions of the block where the new development is proposed (the “South Site” and the “Fairfield Parking Site” located in the PCC MU-1 and COM-3 land use districts respectively).

Dedications Considered Taking if No Nexus Exists.

While the applicant is willing to discuss providing land for street dedication and paying for improvements upon those street dedications without any compensation as part of a development agreement, we think it is important to note that while the City has the right to require all the street dedications specified in the Circulation Element, compensation is required to the property owner for both street dedication and construction of improvements absent a clear nexus between the required dedication and the project related impacts. The traffic report indicates that the project that includes the dedication and construction of the right turn lane on Mariposa Avenue does not create any impacts that would require street widening and thus a taking would occur.

There is substantial case law to support this position. Ehrlich v. City of Culver City (1996) 12 Cal.4th 854, 871 – 873, the California Supreme Court explained the two-step procedure developed by the United States Supreme Court in Nollan v. California Coastal Commission (1987) 483 U.S. 825 and Dolan v. City of Tigard (1994) 512 U.S. 374. When there is a physical dedication, a court must first determine if there is an essential nexus between a legitimate state interest and the permit condition. If such nexus exists, the court must then decide if there is the required degree of connection between the exaction and the impacts of the project, i.e., a rough proportionality. Thirty years ago the California appellate court decided Rohn v. City of Visalia (1989) 214 Cal.App.3d 1463, a case very similar to the present situation. In that case Visalia

wanted a street dedication requirement to rezone property from residential to professional office in order to correct an alignment of the street as shown in the City's General Plan. However, the court found that the dedication could not be required where the studies showed there was no impact from the change in designation.

The law therefore prohibits the City from widening streets to the widths mandated in the determination by the City without the payment of just compensation to the developer. Similarly, absent the required nexus, the City cannot require the developer to make the street improvements.
